

# Electromagnetic Brake Motors

This power off, electromagnetic brake coupled to reversible motors and induction motors (three-phase type) provides output of 6W~90W (three-phase: 25W~90W). These motors are best suited for applications in which loads must be held.

## Safety Standards and CE Marking

## Features

- These motors incorporate AC electromagnetic brakes which are activated when the power is shut off. When the power supply is turned off the motor stops and holds the load. Holding brake force is 4.2 oz-in (30 mN·m) ~ 69.4 oz-in (500 mN·m). These units are excellent as emergency safety brakes.

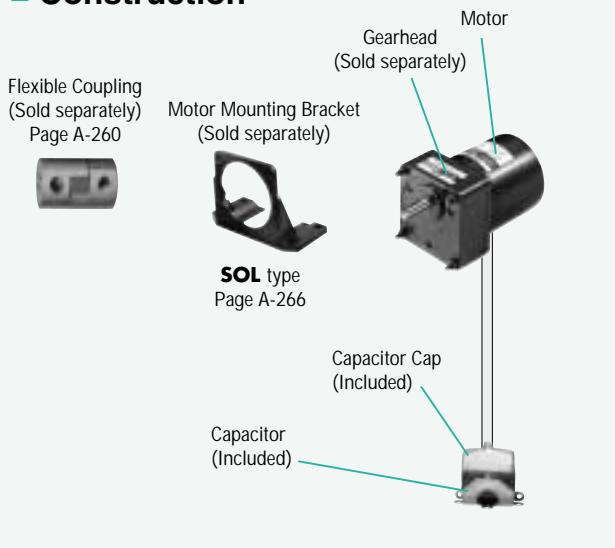

## Structure

The figure above indicates an example of the structure of the electromagnetic brake motor.

The electromagnetic brake operates on the basis of a spring which presses the armature against the brake hub, stopping the motor and holding the load. When the electromagnetic brake is excited, it attracts the armature and the brake lining is pulled away from the brake hub. The motor is able to turn freely.

**(ZP)**: These motors are impedance protected.

**(TP)**: These motors contain a built-in thermal protector. If a motor overheats for any reason, the thermal protector is opened and the motor stops. When the motor temperature drops, the thermal protector closes and the motor restarts. Be sure to turn the motor off before inspecting.

●The "U" and "E" at the end of the model number indicate that the unit includes a capacitor. These two letters are not listed on the motor nameplate. When the motor is approved under various safety standards, the nameplate is adopted.

●A colored background indicates gear shaft rotation in the same direction as the motor shaft; a white background indicates rotation in the opposite direction.

## ■ Motor General Specifications For -AWMU, -CWME, -SWM Type

Item	Specifications
Insulation Resistance	100M Ω or more when 500V DC is applied between the windings and the frame after rated motor operation under normal ambient temperature and humidity.
Dielectric Strength	Sufficient to withstand 1.5kV at 50 and 60 Hz applied between the windings and the frame after rated motor operation under normal ambient temperature and humidity.
Temperature Rise	144°F (80°C) or less measured by the resistance change method after the temperature of 30minute no load operation of motor with connecting a gearhead or equivalent heat radiation plate.*
Insulation Class	Class B 266°F (130°C)
Overheat Protection Device	<b>2RK</b> type is impedance protected. Built-in thermal protector (Automatic return type) Open: 266°F±9°F (130°C±5°C) Close: 179.6°F±27°F (82°C±15°C)
Ambient Temperature Range	14°F~104°F (-10°C~+40°C) Three-Phase 200V : 14°F~122°F (-10°C~+50°C)
Ambient Humidity	85% Maximum (noncondensing)

● Gearheads are sold separately.

● Enter the gear ratio in the box (□) within the model number. A colored background indicates gear shaft rotation in the same direction as the motor shaft; a white background indicates rotation in the opposite direction.

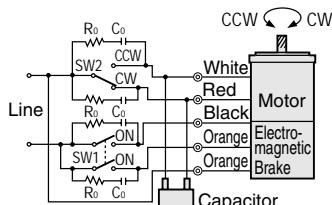

● The speed is calculated by dividing the motor's synchronous speed (60 Hz: 1800 r/min) by the gear ratio. The actual speed is 2 ~ 20% less than the displayed value, depending on the size of the load.

● Right-Angle gearheads may be connected to 25W, 40W, 60W and 90W motors.

● See page A-19 for more information regarding the use of gearheads, maximum permissible torque, permissible overhung load and permissible thrust load.

**Run/Stop:** SW1 operates motor and electromagnetic brake action. Motor will rotate when SW1 is switched to ON (short circuit).

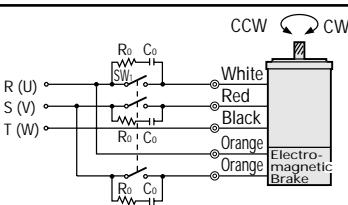

When SW1 is switched to OFF (open), the motor is stopped immediately by the electromagnetic brake and holds the load.

If you wish to release the brake while the motor is stopped, apply voltage between only two brake lead wires (orange). The electromagnetic brake is released and the motor shaft can be rotated easily by hand.

**Direction of Rotation:** To rotate the motor in a clockwise (CW) direction, switch SW2 to CW. To rotate it in a counterclockwise (CCW) direction, switch SW2 to CCW.

Direction of motor rotation are shown when the motor is viewed from the shaft end of the motor.

### ① Normal Connection

### ② Simplified Connection

## ■ Variation in braking time according to connection

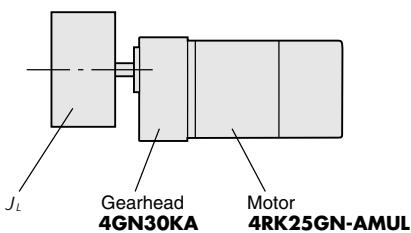

Connection can be simplified by using the wiring diagram shown in figure ②, rather than the normal wiring shown in figure ①.

Using the connection shown in figure ②, however, results in a 50 msec. increase in braking time over that shown in figure ①, with a corresponding increase in overrun.

The reason for this is that the electromagnetic energy of the motor continues to have an effect on the coil of the electromagnetic brake, so that the electromagnet continues to operate for 50 msec. even though the excitation has been canceled. The brake therefore takes longer to engage.

## ■ Starting and Braking Characteristics

As an example, we have calculated the motor starting time, braking time and overrun when driving an inertial load ( $J_L = 1375 \text{ oz-in}^2$ ) for the motor **4RK25GN-AMUL** when combined with the gearbox **4GN30KA**.

First, convert load inertia to its corresponding value at the motor shaft.

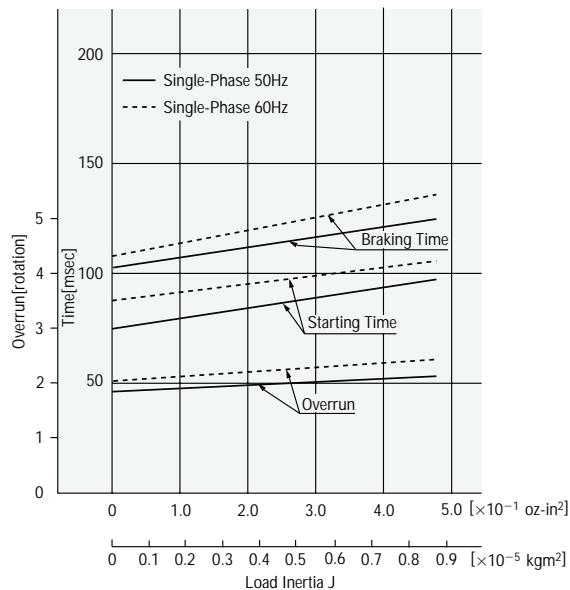

$$J_M = \frac{J_L}{i^2} = \frac{1375}{30^2} \approx 1.5 \text{ [oz-in}^2\text{]}$$

$J_L$ : Inertia of the load [ $\text{oz-in}^2$ ]

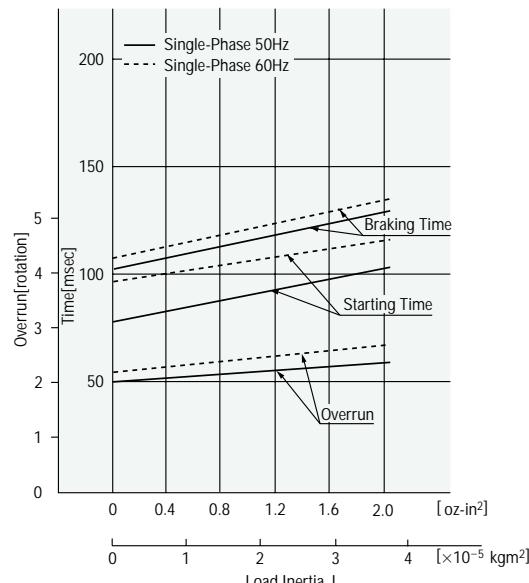

$J_M$ : Inertia at motor shaft [ $\text{oz-in}^2$ ]

$i$ : Gear ratio

### 4RK25GN-AWMU / 4RK25GN-CWME 4RK25GN-AMUL

### ● Overrun

The overrun of the motor shaft based on the graph on the next page is:

$$N_M \approx 2.6 \text{ revolutions}$$

Overrun of gearhead output shaft is:

$$N_G = \frac{N_M}{i} = \frac{2.6}{30} = 0.09 \text{ revolutions (32°)}$$

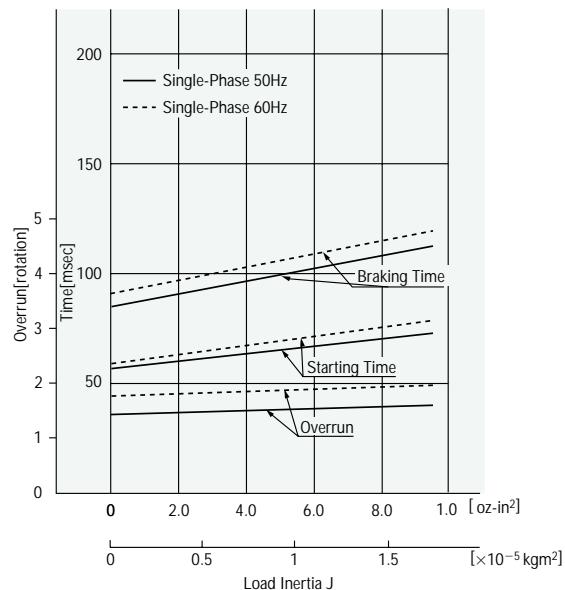

### ● Starting time and braking time

Using the graph again gives:

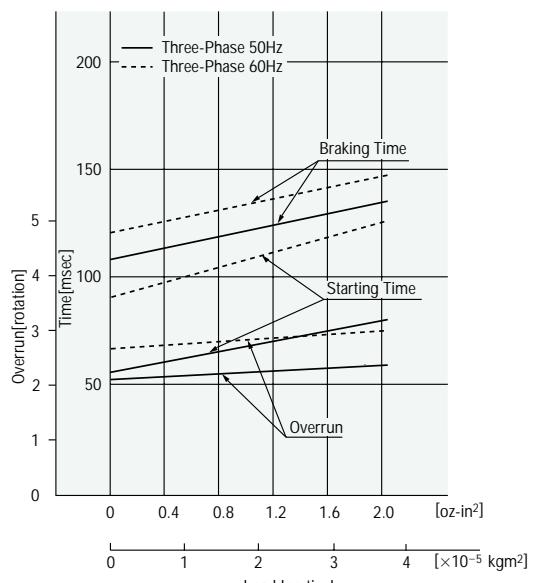

$$\begin{aligned} \text{Starting time} & t_1 \approx 110 \text{ msec} \\ \text{Braking time} & t_2 \approx 130 \text{ msec} \end{aligned}$$

The starting time of an electromagnetic brake motor is equal to the motor starting time plus the electromagnetic brake release time. If the electromagnetic brake is left released, the motor can be started much faster. Optimum time for release of the brake is at least 10 msec. before starting up the motor.

### ■ Right-Angle Gearheads (Sold Separately)

The right-angle gearhead provides an output shaft that is at a right angle to the motor's output shaft. See page [A-216] for specifications and other information.

### ■ Accessories (Sold Separately)

#### ● Motor Mounting Brackets

Optional die-cast aluminum mounting brackets are available. They can be used to install motors without gearheads. See page[A-266] for the dimensions.

#### ● Flexible Coupling

Optional clamp-type couplings are available. See page[A-260] for dimensions.
