Thank you for purchasing an Oriental Motor product. This Operating Manual describes product handling procedures and safety precautions.

- Please read it thoroughly to ensure safe operation.
- Always keep the manual where it is readily available.

1 Introduction

Before use
The BLU series is designed and manufactured for use as an internal component of general industrial equipment. Do not use it for any other purpose. Oriental Motor will not be liable for whatever damage arises from failure to observe this warning.

Product overview
The BLU series is a brushless DC motor unit adopting a thin, high-torque brushless DC motor and a compact driver. The BLU allows motor speed setting and start/stop operation to be controlled only by the driver. This series is well suited for the speed control of transfer equipment and agitators which do not frequently change speed. The BLU is available in three types; [1] single-phase 100-115 V, 50/60 Hz, [2] single-phase 200-230 V, 50/60 Hz, and [3] three-phase 200-230 V, 50/60 Hz. The BLU series consists of the combination type that comes with a dedicated gearhead ideal for high-torque operation through gear reduction, the pinion type compatible with optional dedicated gearheads, and the round shaft type perfect for applications that require high-speed rotational movement.

Standards and CE Marking
This product is recognized by UL and certified by CSA, and bears the CE Marking (Low Voltage Directive and EMC Directives) in compliance with the EN Standards.

</table>

Note: For UL Standard (UL 508C), the product is recognized for the condition of Maximum Surrounding Air Temperature 40 °C (104 °F).

Installation conditions
Overvoltage category III, Pollution degree 2, Class I (For EN Standard). When the machinery to which the driver is mounted requires pollution degree 3 specifications, install the driver in a cabinet that complies with IP54.

Low Voltage Directive
The product is to be machinery incorporated, so it should be installed within an enclosure.

Keep the product within an enclosure to avoid contact with hands.

Be sure to maintain a protective earth in case hands should make contact with the product. Securely ground the protective earth terminals of the motor and driver.

EMC Directives
This product bears the CE Mark under the conditions specified in “Example of motor and driver installation and wiring” (p.10). Be sure to conduct EMC measures with the product assembled in your equipment by referring to 5.9 “Installing and wiring in compliance with EMC Directive (89/336/EEC, 92/31/EEC)” (p.10).

Hazardous substances

2 Safety precautions

Only qualified personnel should work with the product. Use the product correctly after thoroughly reading the section “Safety precautions”. The precautions described below are intended to prevent danger or injury to the user and other personnel through safe, correct use of the product. Please read and understand these precautions thoroughly before using the product.

Warning
Handling the product without observing the instructions that accompany a “Warning” symbol may result in death or serious bodily injury.

Caution
Handling the product without observing the instructions that accompany a “Caution” symbol may result in bodily injury or property damage.

Note
The items under this heading contain important handling instructions that the user should observe to ensure the safe use of the product.

- Do not use the product in explosive or corrosive environments, in the presence of flammable gases, locations subjected to splashing water, or near combustibles. Doing so may result in fire, electric shock or injury.
- Assign qualified personnel the task of installing, wiring, operating/controlling, inspecting and troubleshooting the product. Failure to do so may result in fire, electric shock or injury.
- Do not transport, install the product, perform connections or inspections when the power is on. Always turn the power off before carrying out these operations. Failure to do so may result in electric shock.
- When the protection function is triggered, shut off the power immediately. Turn the power back on only after removing the cause. Continuing the operation without removing the cause of the problem may cause malfunction of the motor and driver, leading to injury or damage to equipment.
- To prevent the risk of electric shock, use the motor and driver for class I equipment only.
- When installing the motor and driver, ground them to prevent the risk of electric shock.
- Keep the driver’s power supply input voltage within the specified range to avoid fire and electric shock.
- Connect the cables securely according to the wiring diagram in order to prevent fire and electric shock.
- Do not rework or modify the motor cable and extension cable (sold separately). Do not remove the sheath of the cable and then ground or touch the shielded wire. This may cause electric shock or trigger the ground fault interrupt circuit.
- Be sure to install the terminal cover of the power connection terminal and input/output signal connection terminal after making connections. Otherwise, fire and electric shock may occur.
- Do not forcibly bend, pull or pinch the cable. Doing so may result in fire and electric shock.
- Turn off the driver power in the event of a power failure, or the motor may suddenly start when the power is restored and may cause injury or damage to equipment.
- Do not use it in a vertical application. When the driver protection function is activated, the motor will stop and movable portions may fall down to cause injury of the operator and damage of the equipment.
- Do not touch the terminals block of the driver immediately after the power is turned off (for a period of 30 seconds). Failure to do so may result in electric shock.
- Do not disassemble or modify the motor, gearhead or driver. This may cause electric shock or injury. Refer all such internal inspections and repairs to the branch or sales office from which you purchased the product.
3 Precautions for use

This chapter explains the restrictions and other items you should take heed of when using the BLU series.

- **Connect protective devices to the power line**
  Connect a circuit breaker or earth leakage breaker to the driver’s power line to protect the primary circuit. If an earth leakage breaker is to be installed, use one incorporating high-frequency noise elimination measures. Refer to 9.2 “Recommended peripherals” (p.15) for the selection of appropriate protective devices.

- **Do not perform gravitational operation**
  With the BLU series, any operation in which the motor output shaft is turned (gravitational operation) will disable the motor speed control. In addition, a gravitational operation will cause the driver’s primary inverter voltage to exceed the allowable value, thereby triggering a protection function and causing the motor to stop spontaneously. When the motor stops, the load may drop.

- **Do not use a solid-state relay (SSR) to turn on/off the power**
  A circuit that turns on/off the power via a solid-state relay (SSR) may damage the motor and driver.

- **Conduct the insulation resistance measurement or withstand voltage test separately on the motor and the driver**
  Conducting the insulation resistance measurement or withstand voltage test with the motor and driver connected may result in injury or damage to equipment.

- **Grease measures**
  On rare occasions, a small amount of grease may ooze out from the gearhead. If there is concern over possible environmental damage resulting from the leakage of grease, check for grease stains during regular inspections. Alternatively, install an oil pan or other device to prevent leakage from causing further damage. Oil leakage may lead to problems in the customer’s equipment or products.

- **Apply grease on the output shaft of hollow shaft flat gearhead**
  If you are using a hollow shaft flat gearhead, apply grease (molybdenum disulfide grease, etc.) on the surface of the load shaft and inner walls of the hollow output shaft to prevent seizure.

- **Noise elimination measures**
  Provide the following noise elimination measures to prevent a motor or driver malfunction caused by external noise.

  **Wiring the motor**
  To extend the wiring between the driver and motor, use the optional extension cable (sold separately).

  **Wiring the I/O signal cable**
  - Minimize the wiring length of the I/O signal cable.
  - Provide a minimum clearance of 100 mm (4 in.) between the I/O signal cable and any inductive load such as an electromagnetic relay or any power line (power cable, motor cable, etc.). Do not place the I/O signal cable and a power line in the same duct or pipe or bundle them together.
  - For more effective elimination of noise, use a shielded I/O signal cable or attach ferrite cores if a non-shielded cable is used.

  **Connecting a mains filter for power line**
  - Connect a mains filter to the AC power input part of the driver to prevent external noise from reaching the driver via the power line.
  - Provide a ground connection from the mains filter ground terminal using a cable of AWG18 (0.75 mm²) or larger.

4 Preparation

This chapter explains what you must do before using the BLU series, as well as the name and function of each part of the unit.

**4.1 Confirming the product**
Open the package and confirm that all of the following items are available.
If any of the items are missing or damaged, please contact the Oriental Motor branch or sales office from where you purchased the product.
Confirm the model of the unit against the model name shown on the package label.
Confirm the models of the motor and driver against the model names shown on their respective nameplates.
Refer to 4.2 “Combination tables” (p.4) for the allowable motor and driver combinations for each unit model.
4.3 Names and functions of parts

4.2 Combination tables

■ Combination type parallel shaft gearhead

The motor comes preassembled with a parallel shaft gearhead.

* Illustration shows combination type parallel shaft gearhead.
5 Installation

5.1 Installation location
The motor and driver are designed and manufactured for use as internal components of equipment. Install the motor and driver in a well-ventilated place where they can be inspected easily and the following conditions are satisfied:

- Inside an enclosure installed indoors (provide a ventilation hole)
- Ambient temperature
  - Motor: 0 to +50 °C (+32 to +122 °F) (non-freezing)
  - Driver: 0 to +40 °C (+32 to +104 °F) (non-freezing)
- The product is recognized/certified by UL/CSA at 0 to +40 °C (+32 to +104 °F).
- Ambient humidity: 85% or less (non-condensing)
- Area that is free of explosive atmosphere or toxic gas (such as sulfuric gas) or liquid
- Area not exposed to direct sun
- Area free of excessive amount of dust, iron particles or the like
- Area not subject to splashing water (rains, water droplets), oil (oil droplets) or other liquids
- Area free of excessive salt
- Area not subject to continuous vibration or excessive shocks
- Area free of excessive electromagnetic noise (from welders, power machinery, etc.)
- Area free of radioactive materials, magnetic fields or vacuum

Install the motor to a flat mounting plate offering excellent vibration resistance and high heat conductivity.

5.2 Installing the combination type parallel shaft gearhead

1. Open mounting holes in the mounting plate.

   ![Diagram of mounting holes](image)

<td>12 mm (0.47 in.)</td>
</tr>
</tbody>
</table>

Note: The figures in the table apply when the supplied hexagonal socket head screw is used.

2. Install the supplied hexagonal socket head screw in the four mounting holes you just opened and tighten the nuts until no gaps remain between the motor and mounting plate.

   ![Diagram of hexagonal socket head screw](image)

<table>
<thead>
<tr>

</tr>
<tr>
<td>BLU590</td>
<td>M8</td>
<td>15.5 N·m (137 lb-in)</td>
</tr>
</tbody>
</table>

Note

- Changing direction of the cable outlet
  The gearhead can be removed and the motor cable position changed to the desired 90° direction.

  1. Remove the hexagonal socket head screws (2 pcs.) assembling the motor and gearhead and detach the motor from the gearhead.

  ![Diagram of cable outlet](image)

  2. Using the pilot sections of the motor and gearhead as guides, install the gearhead to the motor and tighten the hexagonal socket head screws.

  At this time, the motor cable position can be changed to the desired 90° direction.

  When installing the gearhead, slowly rotate it clockwise/counterclockwise to prevent the pinion of the motor output shaft from contacting the side panel or gear of the gearhead.

  Also confirm that no gaps remain between the motor flange surface and the end face of the gearhead’s pilot section.

  ![Diagram of gearhead installation](image)

- Do not forcibly assemble the motor and gearhead. Also, do not let metal objects or other foreign matters enter the gearhead. The pinion or gear of the motor output shaft may be damaged, resulting in noise or shorter service life.

- Do not allow dust to attach to the pilot sections of the motor and gearhead. Also, assemble the motor and gearhead carefully by not pinching the O-ring at the motor’s pilot section. If the O-ring is crushed or severed, grease may leak from the gearhead.

- The hexagonal socket head screws assembling the motor and gearhead are affixing the motor and gearhead only temporarily. When installing the gearhead, be sure to use the supplied four hexagonal socket head screws.
5.3 Installing the combination type hollow shaft flat gearhead

A combination type hollow shaft flat gearhead can be installed by using either its front or rear side as the mounting surface. Install the supplied hexagonal socket head screw in the four mounting holes you opened and tighten the nuts until no gaps remain between the motor and mounting plate. Also, attach the supplied safety cover to the hollow output shaft on the end opposite from the one where the load shaft is installed.

- Using the front side as the mounting surface

When the gearhead is installed by using its front side as the mounting surface, use the boss of the output shaft to align the center.

- Using the rear side as the mounting surface

When the gearhead is installed by using its rear side as the mounting surface, use the boss of the output shaft to align the center.

### Mounting hole dimensions

- **Front Mounting plate**
  - ØA: 70 (2.76) mm
  - ØB: 34 (1.34) mm
  - ØC: 5.5 (0.22) mm
  - ØD: 25 (0.98) mm
  - E: 29 (1.14) mm

- **Rear Mounting plate**
  - ØA: 94 (3.70) mm
  - ØB: 38 (1.50) mm
  - ØC: 6.5 (0.26) mm
  - ØD: 30 (1.18) mm
  - E: 39 (1.54) mm

### Using the front side as the mounting surface

When the gearhead is installed by using its front side as the mounting surface, use the boss of the output shaft to align the center.

### Using the rear side as the mounting surface

When the gearhead is installed by using its rear side as the mounting surface, use the boss of the output shaft to align the center.

### Maximum applicable plate thickness

<table>
<thead>
<tr>
<th>Unit model</th>
<th>Maximum applicable plate thickness</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLU220</td>
<td>5 mm (0.20 in.)</td>
</tr>
<tr>
<td>BLU440</td>
<td>8 mm (0.31 in.)</td>
</tr>
<tr>
<td>BLU590</td>
<td>12 mm (0.47 in.)</td>
</tr>
</tbody>
</table>

* The figures in the table apply when the supplied hexagonal socket head screw is used.

### Changing direction of the cable outlet

The gearhead can be removed and the motor cable position changed to one of three 90° directions.

1. Remove the hexagonal socket head screws (4 pcs.) attaching the hollow shaft flat gearhead and motor and detach the motor from the hollow shaft flat gearhead.

2. Using the pilot sections of the motor and hollow shaft flat gearhead as guides, install the motor to the hollow shaft flat gearhead and tighten the hexagonal socket head screws.

At this time, the motor cable position can be changed to one of three 90° directions.

Install the motor carefully to prevent the pinion of the motor output shaft from contacting the casing or gear of the hollow shaft flat gearhead.

Also confirm that no gaps remain between the motor flange surface and the end face of the hollow shaft flat gearhead’s pilot section.

### Unit model Nominal thread size Tightening torque

<td>15.5 N·m (137 lb-in)</td>
</tr>
</tbody>
</table>
Note

- Do not forcibly assemble the motor and hollow shaft flat gearhead. Also, do not let metal objects or other foreign matters enter the hollow shaft flat gearhead. The pinion of the motor output shaft or the hollow shaft flat gearhead itself may be damaged, resulting in noise or shorter service life.
- Do not allow dust to attach to the pilot sections of the motor and hollow shaft flat gearhead. Also, assemble the motor carefully by not pinching the O-ring at the motor's pilot section. If the O-ring is pinched, the coupling strength will drop and grease may leak from the hollow shaft flat gearhead.

5.5 Installing the pinion shaft type

A pinion shaft motor is used with a parallel shaft gearhead or hollow shaft gearhead assembled to it. Installing a parallel shaft gearhead: ➔ p.5
Installing a hollow shaft flat gearhead: ➔ p.6

5.6 Installing a load on the combination type parallel gearhead or round shaft type

When installing a load on the motor (gearhead), align the center of the motor output shaft (gearhead output shaft) with the center of the load shaft.

Note

- When coupling the motor (gearhead) with a load, pay attention to centering, belt tension, parallelism of pulleys, etc. Also, securely affix the tightening screws of the coupling or pulleys.
- When installing a load, do not damage the motor output shaft (gearhead output shaft) or bearing. Forcing in the load by driving it with a hammer, etc., may break the bearing. Do not apply any excessive force to the output shaft.
- Do not modify or machine the motor (gearhead) output shaft. The bearing may be damaged or motor (gearhead) may break.

Output shaft shape

Combination type parallel shaft gearhead

A key groove is provided on the output shaft of each combination type parallel shaft gearhead. Form a key groove on the load side and affix the load using the supplied parallel key.

Round shaft type

A flat section is provided on the motor output shaft of each round shaft motor. Apply a double-point screw, etc., at the flat section to securely affix the load and prevent it from spinning.

How to install a load

- Using a coupling
  Align the centerline of the motor (gearhead) output shaft with the centerline of the load shaft.
- Using a belt
  Adjust the motor (gearhead) output shaft to lie parallel with the load shaft and form right angles between the output shaft/load shaft and the line connecting the centers of both pulleys.
- Using a gear
  Adjust the motor (gearhead) output shaft to lie parallel with the gear shaft and allow the output shaft to mesh correctly with the centers of the gear teeth.
- When using the output axis tip screw hole of a gearhead
  Use a screw hole [M6, effective depth 12 mm (0.47 in.)] provided at the tip of the output shaft of GFS5G as an auxiliary means for preventing the transfer mechanism from disengaging.
Permissible overhung load and permissible thrust load

Make sure the overhung load and thrust load received by the gearhead output shaft will not exceed the allowable values shown in the table below.

**Note**

If the overhung load or thrust load exceeds the specified allowable value, repeated load applications may cause the bearing or output shaft of the gearhead to undergo a fatigue failure.

---

*1 Indicates the power supply specification (A, C or S).
*2 Minimize the thrust load. If a thrust load must be applied, do not let it exceed one-half the motor's dead weight.

---

5.7 Installing a load on the combination type hollow shaft flat gearhead

If the motor is subject to a strong impact upon instantaneous stop or receives a large overhung load, use a stepped load shaft.

**Note**

Apply grease (molybdenum disulfide grease, etc.) on the surface of the load shaft and inner walls of the hollow output shaft to prevent seizure.

**Permissible overhung load and permissible thrust load**

Make sure the overhung load and thrust load received by the gearhead output shaft will not exceed the allowable values shown in the table below.

**Note**

If the overhung load or thrust load exceeds the specified allowable value, repeated load applications may cause the bearing or output shaft of the gearhead to undergo fatigue failure.

- **Combination type hollow shaft flat gearhead**

5.8 Installing the driver

**Installation direction**

The driver is designed based on the assumption of heat radiation due to air convection. When you want to install the driver inside the housing, install it to ensure that one of the two heat radiation holes of the driver faces downward.

**Note**

- Install the driver 25 mm (1 in.) or more away from the housing and other equipment inside the housing in the horizontal direction, and 50 mm (2 in.) or more away in the vertical direction.
- Around the driver, do not install the equipment which generates a great deal of heat or noise.
- If the ambient temperature of the driver exceeds 40 °C (104 °F), review the ventilation conditions or forcibly cool driver with a fan.
5.9 Installing and wiring in compliance with EMC Directive (89/336/EEC, 92/31/EEC)

The BLU series is designed and manufactured for use as an internal component of equipment. The EMC Directives require that your mechanical equipment in which the BLU series is installed satisfy the applicable requirements.

The installation/wiring methods of the motor and driver explained here represent the basic methods that are effective in helping your mechanical equipment conform to the EMC Directives. The final level of conformance of your mechanical equipment to the EMC Directives will vary depending on the control system equipment used with the motor/driver, configuration of electrical parts, wiring, layout, hazard level, and the like. Therefore, you must conduct the EMC tests on your mechanical equipment to confirm compliance.

### Applicable standards

**EMI**
- Emission Tests: EN 61000-6-4
- Radiated Emission Test: EN 55011
- Conducted Emission Test: EN 55011

**EMS**
- Immunity Tests: EN 61000-6-2
- Electrostatic Discharge Immunity Test: IEC 61000-4-2
- Radiation Field Immunity Test: IEC 61000-4-3
- Fast Transient/Burst Immunity Test: IEC 61000-4-4
- Surge Immunity Test: IEC 61000-4-5
- Conductive Noise Immunity Test: IEC 61000-4-6
- Power Frequency Magnetic Field Immunity Test: IEC 61000-4-8
- Voltage Dip Immunity Test: IEC 61000-4-11
- Voltage Interruption Immunity Test: IEC 61000-4-11

Without effective measures to suppress the electromagnetic interference (EMI) caused by the BLU series in the surrounding control system equipment or the electromagnetic spectrum (EMS) generated by the BLU series, the function of your mechanical equipment may be seriously affected. The BLU series will conform to the EMC Directives if installed/wired using the methods specified below.

### Connecting a mains filter

Install a mains filter in the power line in order to prevent the noise generated within the driver from propagating outside via the AC input line. For mains filters, use the products as shown in the chart, or an equivalent.

</tbody>
</table>

Install the mains filter as close to the driver as possible, and use cable clamps and other means to secure the input and output cables firmly to the surface of the enclosure. Connect the ground terminal of the mains filter to the grounding point, using as thick and short a wire as possible.

Do not place the AC input cable (AWG22: 0.3 mm² or more) parallel with the mains-filter output cable (AWG22: 0.3 mm² or more). Parallel placement will reduce mains-filter effectiveness if the enclosure’s internal noise is directly coupled to the power supply cable by means of stray capacitance.

### Grounding procedure

The cable used to ground the motor, driver and mains filter must be as thick and short to the grounding point as possible so that no potential difference is generated. Choose a large, thick and uniformly conductive surface for the grounding point.

- **Grounding the driver**
  - Ground the protective earth terminal at the rear of the driver. Refer to the 6.2 “Connecting the power supply” (p.11) for the way to ground the driver.

- **Grounding the motor**
  - Ground the motor by using the protective earth terminal of the motor cable. Refer to the 6.1 “Connecting the motor” (p.11) for the way to ground the driver.

### Connecting the motor cable

To expand connection between the motor and driver, use the optional extension cable.

Connection can be extended to a maximum of 10.5 m (34.4 ft.).

### Wiring the signal cable

For the signal cable for the driver, use a shielded cable of AWG28 (0.08 mm²) or more in diameter, and keep it as short as possible. To ground a shielded cable, use a metal cable clamp or similar device that will maintain contact with the entire circumference of the shielded cable. Attach a cable clamp as close to the end of the cable as possible, and connect it to an appropriate grounding point as shown in the figure.

### Notes about installation and wiring

- Connect the motor/driver and other peripheral control equipment directly to the grounding point so as to prevent a potential difference from developing between grounds.
- When relays or electromagnetic switches are used together with the system, use mains filters and CR circuits to suppress surges generated by them.
- Keep cables as short as possible without coiling and bundling extra lengths.
- Place the power cables such as the motor and power supply cables as far apart (100 to 200 mm (4 to 8 in.)) as possible from the signal cables. If they must cross, do so at a right angle. Place the AC input cable and output cable of a mains filter separately from each other.

### Example of motor and driver installation and wiring

![Diagram of motor and driver installation and wiring]

**Motor**
- Motor cable [10.5 m (34.4 ft.)]

**Driver**
- Cable clamp
- Signal cable (Shielded cable) [2 m (6.6 ft.)]

**Power cable**

**Mains filter**

**Grounded panel**

**Precautions about static electricity**

Static electricity may cause the driver to malfunction or become damaged. Do not come close to or touch the driver while the power is on except when operating the speed setting potentiometer or switch of the front of driver.
6 Connection

6.1 Connecting the motor
Insert the motor cable connector into the motor connector (MOTOR) of the driver.
To expand connection between the motor and driver, use the optional extension cable. Connection can be extended to a maximum of 10.5 m (34.4 ft.).
Connect the protective earth conductor of the motor (green/yellow) to the driver as shown.
When an extension cable is used or direct contact between the hands and motor is anticipated, connect the protective earth conductor of the motor directly to the ground. If the protective earth conductor is not sufficiently long, use a lead wire with a diameter equivalent to AWG18 (0.75 mm²) or more. For connection, use the insulated round crimp terminal.

Note
After shutting down the power, wait at least 30 seconds before turning it back on, unplugging, or plugging in the motor’s cable connector.

Note
Have the connector plugged in securely. Insecure connection may cause malfunction or damage to the motor or driver.

6.2 Connecting the power supply
Connect the power cable to the driver. Connect the red lead wire and black lead wire to the power connection terminal, and the green/yellow lead wire to the protective earth terminal. For the power cable, use the attached power cable or a cable with a diameter equivalent to AWG22 (0.3 mm²) or more. For the protective earth conductor, use a cable with a diameter equivalent to AWG18 (0.75 mm²) or more. For connection, use the insulated round crimp terminal.

Applicable crimp terminal

6.3 Input/Output signals

■ Signal input circuit
The signal input circuit is initially set to sink logic. Switch the circuit mode between sink logic and source logic according to the external control equipment used.
Input signals of the driver are provided as photocoupler inputs. The signal state indicates the “ON: current supplied” or “OFF: current not supplied” status of the internal photocoupler rather than the voltage level of the signal.

■ Signal output circuit
The signal input circuit is initially set to sink logic. Switch the circuit mode between sink logic and source logic according to the external control equipment used.
Output signals of the driver are provided as transistor open-collector outputs. The signal state indicates the “ON: current supplied” or “OFF: current not supplied” status of the internal photocoupler rather than the voltage level of the signal.
The ON voltage of the output circuit is approx. 1.5 V. Exercise caution when driving other elements using the output circuit.
### Sink logic

**Input circuit**

![Sink logic input circuit diagram]

**Output circuit**

![Sink logic output circuit diagram]

### Source logic

**Input circuit**

![Source logic input circuit diagram]

### Output circuit

![Sink logic output circuit diagram]

### Note

- **When you want to extend the input/output signal cable, the length must not exceed 2 m (6.6 ft.). The cable should be as short as possible in order to minimize noise.**
- **The input/output signal cable should be connected to run perpendicular to the power cable and motor cable, not in parallel with the power cable and motor cable.**
- **Signal output is an open collector output. Use a power supply of 26.4 VDC or less to connect the limit resistance (R) to limit output current to 0.5 to 10 mA.**

**Connection example of signal output (sink logic)**

![Connection example of signal output (sink logic)]

### SPEED output

Concurrently with motor drive, the system outputs pulse signals (with a width of about 0.5 ms) at 30 pulses per rotation of the motor output shaft.

You can measure the SPEED output frequency and calculate motor speed.

\[
\text{Motor speed (r/min)} = \frac{\text{SPEED output frequency (Hz)}}{30} \times 60
\]

If you want to indicate or monitor the motor output shaft speed and determine the speed of the gear head output shaft, use an optional digital speed indicator **SDM496**.

### Note

- **The digital speed indicator SDM496 is not certified by the recognized safety standards.**
- **When the digital speed indicator is used with the BLU series, which is certified by the recognized safety standards and/or the conformed safety standards, the BLU series itself is not in conformance with the safety standards.**
- **The SDM496 cannot be used with source logic circuits.**
ALARM output
In the following cases, the protection function of the driver is enabled to turn off the ALARM output and to stop the motor. In this case, the LED flashes or lights up to allow the protection function to be checked.

- It is normal that the LED lamp will turn on at the moment of the connection with power supply.
- LED lamp flashes when the following protection function

Overload protection function
The LED lamp flashes when a load in excess of the rated torque is applied to the motor for about 5 seconds or more, or when the motor is instantly stopped or when the direction of rotation is switched repeatedly in a short period of time.

- LED lamp ON when the following protection function

Motor sensor error
Prevents motor malfunction when the sensor cable within the motor cable is disconnected during motor operation. (An alarm signal will not be output while the motor is at a standstill.)

Overvoltage protection function
When the motor is used in an elevating/lowering application or with a load in excess of the permissible load inertia, or when voltage applied to the driver has exceeded the voltage setting (115 VAC or 230 VAC) by 20% or greater.

Insufficient voltage protection function
When voltage applied to the driver is less than the voltage setting (100 VAC or 200 VAC) by 30% or greater.

Overspeed protection function
When motor speed has reached an excess of 2500 r/min.

When an electrical connection is made as shown in the example, the ALARM output is turned on if the driver is normal but is turned off in the event of alarm.

When the ALARM output is turned off, turn off the power to the driver once the motor stops.

If the motor cable is free of any trouble, check the operating conditions (load torque, running pattern and power supply voltage). After removing the cause for activating the protection function, turn on power again and reset the alarm.

Once power has been turned off, wait at least 30 seconds before turning it on again.

7 Operation

Running by the RUN/STAND-BY switch of the driver (Use the short circuit bar.)
When the RUN/STAND-BY switch is set to the RUN position, and the motor is driven. When it is set to the STAND-BY position, the motor will stop. Operation is not performed in the STAND-BY mode.

Drive direction depends on how the short circuit bar is connected.

Clockwise direction

Counter-clockwise direction

Connect the attached short circuit piece between the CW and COM or CCW and COM.
Do not use the short circuit bar for other purposes.

Note
The RUN/STAND-BY switch is not a power ON/OFF switch. When you want to stop the motor for a long time, turn off the driver power.

Running by external signals
Set the RUN/STAND-BY switch to the RUN position.

Small-capacity switch and relay
Use a small-capacity contact type relay capable of opening and closing 14 VDC, 10 mA.

Transistor output type external control equipment
Sink logic
Source logic
If the source logic is used, the CW input and CCW input cannot connect to external control equipment of transistor output type.

Note
When you want to use the external control equipment with a built-in clamp diode, pay attention to the sequence of turning on or off the power.
Power ON: External control equipment ON → Driver ON
Power OFF: Driver OFF → External control equipment OFF
If the driver power is turned on first when connected as shown, or the external control equipment power is turned on with the driver power turned on, current will be applied, as indicated by arrow mark of the diagram, and this may cause the motor to be driven. When the power is turned on or off simultaneously, the motor may be driven temporarily due to differences in power capacity. The external control equipment power must be turned on first, and driver power must be turned off first.

Connection example
7.1 Rotating direction of the motor output shaft
The rotating direction of the motor output shaft is defined as clockwise (CW) or counterclockwise (CCW) as viewed from the motor output shaft.

- Rotating direction of the gearhead output shaft
The rotating direction of the gearhead output shaft may be opposite that of the motor shaft, depending on the gear ratio. For the rotating direction of the output shaft of a specific gearhead used, refer to the operating manual for the gearhead.

- Combination type parallel gearhead
  Gear ratio: 5, 10, 15, 20 or 200
  ..........Same as the rotating direction of motor output shaft
  Gear ratio: 30, 50 or 100
  ..........Opposite the rotating direction of motor output shaft

- Combination type hollow shaft flat gearhead
The rotating direction is opposite to the motor direction, when viewed from the front side, at all gear ratios.
With a combination type hollow shaft flat gearhead, the rotating direction will vary depending on whether the motor unit is viewed from the front or rear of the gearhead.

7.2 Setting the acceleration time and deceleration time
The motor starts over the specified acceleration time and stops over the specified deceleration time. These acceleration time and deceleration time can be set in the range of 0.5 to 10 seconds (in a no-load state at 2000 r/min). The actual acceleration and deceleration times may vary depending on the conditions of use, load inertia, load torque and other conditions of your specific application.

- How to remove front panel
In order to set the acceleration time and deceleration time, remove the front panel.

1. Remove the control knob of the speed setting potentiometer. Put a flat tip screwdriver or the like between the front panel and the control knob. Then, pull the control knob toward you, and it will be removed. (Keep the knob completely at the LOW position.)

2. Remove front panel
Hold only the front panel, and pull it toward you. Then the front panel can be removed. In this case, the RUN/STAND-BY switch is also removed together. Care should be taken not to lose it. Reverse the above steps if you want to install the front panel.

- Setting the acceleration time and deceleration time
The figure shows a view with the front panel removed.
8 Troubleshooting and remedial actions

An erroneous speed setting or connection may prevent the motor/driver from operating properly. If proper motor operation cannot be achieved, take an appropriate action by referring to this chapter. If the information provided here does not help, please call our Tech Support Line.

- **Digital speed indicator (SDM496)**
Used to display/monitor the speed of the motor output shaft and the decelerated speed of the gearhead output shaft.

**Note**
- The digital speed indicator SDM496 is not certified by the recognized safety standards. When the digital speed indicator is used with the BLU series, which is certified by the recognized safety standards and/or the conformed safety standards, the BLU series itself is not in conformance with the safety standards.
- The SDM496 cannot be used with source logic circuits.

9.2 Recommended peripherals

- **Circuit breaker or earth leakage breaker**
Be sure to connect a circuit breaker or earth leakage breaker to the power line of the driver to protect the primary circuit.

**Note**
- The optional parts and accessories are the same as for the BLU series, with the exception of the digital speed indicator SDM496.

9.3 Use of the driver with Mains filter

- The driver can be used with a mains filter. Use a mains filter that meets the following conditions.
  - The input voltage is within the specified range.
  - The output voltage is within the specified range.
  - The maximum input current is within the specified range.
  - The maximum output current is within the specified range.

**Note**
- Be sure to use the mains filter specified for the series.

15
