- Product overview

The BLE Series is a line of units, each consisting of a compact, high-torque brushless motor and a high-functional box-type driver.

Each unit has a FBL II compatible mode, so existing users of FBL II Series units can use the BLE Series units with the same settings.

With the peripheral equipment data setter OPX-2A (sold separately) or support software MEXE02, you can improve the performance and set operation data/parameters and motor operations with ease.

- Standards and CE Marking

This product is recognized by UL. The CE Marking (Low Voltage Directive and EMC Directive) is affixed to the product in accordance with EN Standards.

The name of products certified to conform with relevant standards are represented by applicable unit model motor and driver part numbers.

**WARNING**
Handling the product without observing the instructions that accompany a "WARNING" symbol may result in death or serious bodily injury.

**CAUTION**
Handling the product without observing the instructions that accompany a "CAUTION" symbol may result in bodily injury or property damage.

**Note**
The items under this heading contain important handling instructions that the user should observe to ensure the safe use of the product.

---

**WARNING**

- Do not use the product in a place exposed to explosive, flammable or corrosive gases or water splashes or near combustible materials. Doing so may result in fire, electric shock or injury.
- Only qualified personnel should be allowed to perform installation, connection, operation and inspection/troubleshooting of the product. Handling by unqualified personnel may result in fire, electric shock, injury or equipment damage.
- Do not move, install, connect or inspect the product while the power is supplied. Perform these operations after turning off the power. Failure to observe these instructions may result in electric shock.
- The terminals on the driver’s front panel marked with \( \Delta \) symbol indicate the presence of high voltage. Do not touch these terminals while the power is on to avoid the risk of fire or electric shock.
- Do not use a non-electromagnetic brake type motor in a vertical application. If the driver’s protection function is activated, the motor will stop and the moving part of the equipment will drop, thereby causing injury or equipment damage.
- Do not use the brake mechanism of the electromagnetic brake motor as a safety brake. It is intended to hold the moving parts and motor position. Doing so may result in injury or damage to equipment.
- If the driver’s protection function has been activated, remove the cause and then reset the protection function. Continuing to operate the equipment without removing the cause of problem will lead to a motor or driver malfunction, resulting in injury or equipment damage.
- Use a specified motor (gearhead) and driver combination. Failure to do so may result in fire, electric shock or equipment damage.
- Use the motor and driver only in class I equipment. When installing the motor and driver, connect their Protective Earth Terminals. Failure to do so may result in electric shock.
- Install the motor and driver in an enclosure. Failure to do so may result in electric shock or injury.
- Securely connect the cables in accordance with the connection examples. Failure to do so may result in fire or electric shock.
- Do not forcibly bend, pull or pinch the cables. Doing so may result in fire or electric shock.
- Do not machine or modify the motor cable or connection cable. Doing so may result in electric shock or fire.
- Be sure to observe the specified cable sizes. Use of unspecified cable sizes may result in fire.
- Observe the specified screw tightening torque when connecting terminals to the terminal block. Failure to do so may result in electric shock or equipment damage.
- Always keep the driver’s power supply voltage below the rating. Failure to do so may result in fire or electric shock.
- When using the electromagnetic brake motor, do not turn the MB-FREE input ON while a load is held in vertical direction. Otherwise, the holding power of the motor and electromagnetic brake will be lost, causing personal injury or damage to equipment.
- When using the electromagnetic brake motor in vertical drive (gravitational operation), be sure to operate after checking the load condition. If a load in excess of the rated torque is applied or the small torque limiting value is set using a **OPX-2A** or **MEXE02**, the load may fall. This may result in injury or damage to equipment.
- Always turn off the power before performing maintenance/inspection. Failure to do so may result in electric shock.
- Do not touch the motor or driver when measuring insulation resistance or performing a dielectric strength test. Accidental contact may result in electric shock.
- Do not touch the connection terminals on the driver immediately (within 30 seconds or until the CHARGE LED turns off) after the power is turned off. Residual voltage may cause electric shock.
- Regularly check the openings in the driver for accumulated dust. Accumulated dust may cause fire.
- Do not disassemble or modify the motor (gearhead) and driver. Doing so may result in electric shock, injury or equipment damage. Should you require inspection or repair of internal parts, please contact the Oriental Motor branch or sales office from which you purchased the product.
Safety precautions

Do not use the product in conditions exceeding the motor (gearhead) or driver specifications. Doing so may result in electric shock, fire, injury or equipment damage.

Do not insert an object into the openings in the driver. Doing so may result in fire, electric shock or injury.

Do not touch the motor (gearhead) or driver during the operation or immediately after the operation has stopped. Touching a hot motor (gearhead) or driver surface may cause a skin burn(s).

Do not carry the product by the motor (gearhead) output shaft or any of the cables. Doing so may result in injury.

Do not touch the motor output shaft (key groove or pinion) with bare hands. Doing so may result in injury.

When assembling the motor (pinion shaft) with the gearhead, exercise caution not to pinch your fingers or other parts of your body between the motor and gearhead. Injury may result.

Securely affix the motor (gearhead) and driver to their respective mounting plates. Inappropriate installation may cause the motor/driver to detach and fall, resulting in equipment damage.

Provide a cover on the rotating part (output shaft) of the motor (gearhead). Failure to do so may result in injury.

When installing the motor (gearhead) in the equipment, exercise caution not to pinch your fingers or other parts of your body between the equipment and motor or gearhead. Injury may result.

Securely install the load on the motor output shaft. Inappropriate installation may result in injury.

For the I/O signals power supply, use a DC power supply with reinforced insulation on its primary and secondary sides. Failure to do so may result in electric shock.

Provide an emergency stop device or emergency stop circuit external to the equipment so that the entire equipment will operate safely in the event of a system failure or malfunction. Failure to do so may result in injury.

Immediately when trouble has occurred, stop running and turn off the driver power. Failure to do so may result in fire, electric shock or injury.

Do not touch the rotating part (output shaft) during operation. Doing so may result in injury.

The motor surface temperature may exceed 70 °C (158 °F) even under normal operating conditions. If the operator is allowed to approach a running motor, attach a warning label as shown to the right in a conspicuous position. Failure to do so may result in skin burn(s).

Use an insulated screwdriver to adjust the internal speed potentiometer, acceleration time potentiometer, deceleration time potentiometer and switches in the driver. Failure to do so may result in electric shock.

**Warning information**

A warning label with handling instructions is attached on the driver. Be sure to observe the instructions on the label when handling the driver.
3 Precautions for use

This chapter explains the restrictions and other items you should take heed of when using the BLE Series.

● Connect protective devices to the power line
Connect a circuit breaker or earth leakage breaker to the driver’s power line to protect the primary circuit. If an earth leakage breaker is to be installed, use one incorporating high-frequency noise elimination measures. Refer to “Preventing leakage current” below for the selection of protective devices.

● Use an electromagnetic brake type for an application involving vertical travel
When the motor is used in an application involving vertical travel, use an electromagnetic brake type to hold the load in position.

● Do not use a solid-state relay (SSR) to turn on/off the power
A circuit that turns on/off the power via a solid-state relay (SSR) may damage the motor and driver.

● Conduct the insulation resistance measurement or withstand voltage test separately on the motor and the driver
Conducting the insulation resistance measurement or withstand voltage test with the motor and driver connected may result in injury or damage to the product.

● Grease measures
On rare occasions, grease may ooze out from the gearhead. If there is concern over possible environmental damage resulting from the leakage of grease, check for grease stains during regular inspections. Alternatively, install an oil pan or other device to prevent leakage from causing further damage. Grease leakage may lead to problems in the customer’s equipment or products.

● Apply grease to the output shaft of a hollow shaft flat gearhead
If you are using a hollow shaft flat gearhead, apply grease (molybdenum disulfide grease, etc.) on the surface of the load shaft and inner walls of the hollow output shaft to prevent seizure.

● Preventing leakage current
Stray capacitance exists between the driver’s current-carrying line and other current-carrying lines, the earth and the motor, respectively. A high-frequency current may leak out through such capacitance, having a detrimental effect on the surrounding equipment. The actual leakage current depends on the driver’s switching frequency, the length of wiring between the driver and motor, and so on.
When connecting an earth leakage breaker, use one of the following products offering resistance against high frequency current:
Mitsubishi Electric Corporation: NV series

● Noise elimination measures
Provide noise elimination measures to prevent a motor or driver malfunction caused by external noise. For more effective elimination of noise, use a shielded I/O signal cable or attach ferrite cores if a non-shielded cable is used. Refer to p.23 for the noise elimination measures.

● Note on connecting a power supply whose positive terminal is grounded
The communication connector (CN3) and I/O signal connector (CN5) are not insulated. When grounding the positive terminal of the power supply, do not connect any equipment (PC, etc.) whose negative terminal is grounded. Doing so may cause the driver and PC to short, damaging both.

● Use a connection cable (supplied or sold separately) when extending the wiring distance between the motor and driver

● When using the motor in operation such as vertical drive (gravitational operation) or a large inertial load drive, use a regeneration unit (sold separately).
The driver may be damaged if the regeneration energy generated during vertical drive (gravitational operation) or sudden starting/stoping of a large inertial load exceeds the allowable limit that can be absorbed by the driver. The regeneration unit (sold separately) is designed to discharge the regenerated energy, thereby protecting the driver.

This chapter explains the installation location and installation methods of the motor and driver, as well as how to install a load and external potentiometer. Also covered in this section are the installation and wiring methods that are in compliance with the relevant EMC Directive.

6.1 Installation location

The motor and driver are designed and manufactured for use as internal components of equipment. Install the motor and driver in a well-ventilated place where they can be inspected easily and the following conditions are satisfied:

- Inside an enclosure installed indoors (provide a ventilation hole)
- Ambient temperature: 0 to +50 °C (+32 to +122 °F) (non-freezing)
- Ambient humidity: 85% or less (non-condensing)
- Area not exposed to direct sun
- Area free of excessive amount of dust, iron particles or the like
- Area free of excessive salt
- Area that is free of explosive atmosphere or toxic gas (such as sulfuric gas) or liquid
- Area not subject to splashing water (rain, water droplets), oil (oil droplets) or other liquids
- Area not subject to continuous vibration or excessive shocks
- Area free of excessive electromagnetic noise (from welders, power machinery, etc.)
- Area free of radioactive materials, magnetic fields or vacuum

6.2 Installation overview

This section explains an overview of how to install the motor and driver. Refer to each applicable section for details.

Installing the combination parallel shaft gearhead or round shaft type

Install the hexagonal socket head screw in the four mounting holes you drilled and tighten the nuts until no gaps remain between the motor and mounting plate.

The combination type parallel shaft gearheads come with a set of hexagonal socket head screws. Round shaft types do not come with hexagonal socket head screws. Hexagonal socket head screws must be provided by the customer if a round shaft type is used.

Refer to p.13 for the machining dimensions of the mounting plate and how to install/remove the gearhead.

Installing the combination type hollow shaft flat gearhead

A combination type hollow shaft flat gearhead can be installed by using either its front or rear side as the mounting surface. Install the supplied hexagonal socket head screw set in the four mounting holes you drilled and tighten the nuts until no gaps remain between the motor and mounting plate.

Also, attach the supplied safety cover to the hollow output shaft on the end opposite from the one where the load shaft is installed.

Refer to p.14 for the installation method and how to install/remove the gearhead.

Installing the driver

The driver can be installed in two different ways. Refer to p.20 for the specific installation methods.

Removing/Installing the gearhead

To replace the gearhead or change the cable outlet direction, remove the screws assembling the gearhead. The gearhead can be removed and the motor cable position changed to a desired 90° direction.

1. Remove the hexagonal socket head screws (2 pcs.) assembling the motor and gearhead and detach the motor from the gearhead.

2. Using the pilot sections of the motor and gearhead as guides, install the gearhead to the motor and tighten the hexagonal socket head screws.
At this time, the motor cable position can be changed to a desired 90° direction.
When installing the gearhead, slowly rotate it clockwise/ counterclockwise to prevent the pinion of the motor output shaft from contacting the side panel or gear of the gearhead.
Also confirm that no gaps remain between the motor flange surface and the end face of the gearhead’s pilot section.

Note

- Do not forcibly assemble the motor and gearhead. Also, do not let metal objects or other foreign matter enter the gearhead. The pinion or gear of the motor output shaft may be damaged, resulting in noise or shorter service life.
- Do not allow dust to attach to the pilot sections of the motor and gearhead. Also, assemble the motor and gearhead carefully by not pinching the O-ring at the motor’s pilot section. If the O-ring is crushed or severed, grease may leak from the gearhead.
- The hexagonal socket head screws assembling the motor and gearhead are affixing the motor and gearhead only temporarily. When installing the gearhead, be sure to use the supplied hexagonal socket head screws (4 pcs.).
6.4 Installing the round shaft type

Install the motor to a mounting plate of the following size or larger, so that the motor case temperature will not exceed 90 °C (194 °F).

**Note**
When installing the gearhead by using its rear side as the mounting surface, prevent contact between the mounting plate and motor by keeping dimension E below the specified value.
Removing/Installing the gearhead

To replace the gearhead or change the cable outlet direction, remove the screws assembling the gearhead. The gearhead can be removed and the motor cable position changed to one of three 90° directions. Note that the motor cable cannot be positioned in the direction where the cable faces the gearhead output shaft.

1. Remove the hexagonal socket head screws (4 pcs.) attaching the gearhead and motor and detach the motor from the gearhead.

2. Using the pilot sections of the motor and gearhead as guides, install the motor to the gearhead and tighten the hexagonal socket head screws. At this time, the motor cable position can be changed to one of three 90° directions. Install the motor carefully to prevent the pinion of the motor output shaft from contacting the casing or gear of the gearhead. Also confirm that no gaps remain between the motor flange surface and the end face of the gearhead’s pilot section.

**Note**

- Do not forcibly assemble the motor and gearhead. Also, do not let metal objects or other foreign matters enter the gearhead. The pinion or gear of the motor output shaft may be damaged, resulting in noise or shorter service life.
- Do not allow dust to attach to the pilot sections of the motor and gearhead. Also, assemble the motor carefully by not pinching the O-ring at the motor’s pilot section. If the O-ring is pinched, the coupling strength will drop and grease may leak from the gearhead.
- The motor cable position cannot be changed to the direction where the cable faces the gearhead output shaft, because the gearhead case will obstruct the cable.
6.6 Installing a load

- Combination type parallel gearhead or round shaft type

When installing a load on the motor (gearhead), align the center of the motor output shaft (gearhead output shaft) with the center of the load shaft.

**Note**
- When coupling the motor (gearhead) with a load, pay attention to centering, belt tension, parallelism of pulleys, etc. Also, securely affix the tightening screws of the coupling or pulleys.
- When installing a load, do not damage the motor output shaft (gearhead output shaft) or bearing. Forcing in the load by driving it with a hammer, etc., may break the bearing. Do not apply any excessive force to the output shaft.
- Do not modify or machine the motor (gearhead) output shaft. The bearing may be damaged or motor (gearhead) may break.

- Output shaft shape

**Combination type parallel shaft gearhead**

A key groove is provided on the output shaft of each combination type parallel shaft gearhead. Form a key groove on the load side and affix the load using the supplied parallel key.

**Round shaft type**

A flat section is provided on the motor output shaft of each round shaft type. Apply a double-point screw, etc., at the flat section to securely affix the load and prevent it from spinning.

- How to install a load

**Using a coupling**

Align the centerline of the motor (gearhead) output shaft with the centerline of the load shaft.

**Using a belt**

Adjust the motor (gearhead) output shaft to lie parallel with the load shaft and form right angles between the output shaft/load shaft and the line connecting the centers of both pulleys.

**Using a gear**

Adjust the motor (gearhead) output shaft to lie parallel with the gear shaft and allow the output shaft to mesh correctly with the centers of the gear teeth.

**When using the output axis tip screw hole of a gearhead**

Use a screw hole provided at the tip of the output shaft as an auxiliary means for preventing the transfer mechanism from disengaging. (GFS2G type have no output shaft tip screw hole.)

* The square box in the gearhead model will contain a value representing the gear ratio.
• **Combination type hollow shaft flat gearhead**

If the motor is subject to a strong impact upon instantaneous stop or receives a large radial load, use a stepped load shaft.

*Note* Apply grease (molybdenum disulfide grease, etc.) on the surface of the load shaft and inner walls of the hollow output shaft to prevent seizure.

• **Stepped load shaft**

**Affixing method using retaining ring**

Install each hexagonal socket head screw over a retaining ring, spacer, flat washer and spring washer and securely affix the ring.

**Affixing method using end plate**

Affix the load shaft by tightening the hexagonal socket head screw over an end plate, flat washer and spring washer.

*Note* The safety cover (supplied) cannot be attached due to contact between the safety cover and hexagonal socket head screw. Take safety measures against rotating part.
Non-stepped load shaft

Install each hexagonal socket head screw over a retaining ring, spacer, flat washer and spring washer and securely affix the ring. Also insert a spacer on the load shaft side.

6.7 Permissible radial load and permissible axial load

Make sure the radial load and axial load received by the motor (gearhead) output shaft will not exceed the allowable values shown in the table below.

Note: If the radial load or axial load exceeds the specified allowable value, repeated load applications may cause the bearing or output shaft of the motor (gearhead) to undergo a fatigue failure.

* The values assume a rated speed of 3000 r/min or below. The values in [ ] are based on a rated speed of 4000 r/min.
6.8 Installing the driver

The driver is designed so that heat is dissipated via air convection and conduction through the enclosure. Install the driver to a flat metal plate offering excellent vibration resistance.

When two or more drivers are to be installed side by side, provide 20 mm (0.79 in.) and 25 mm (0.98 in.) clearances in the horizontal and vertical directions, respectively.

**Note**

- Install the driver in an enclosure whose pollution degree is 2 or above or protection class is IP54 or better.
- Be sure to install (position) the driver vertically. Do not block the radiation openings.
- Do not install any equipment that generates a large amount of heat or noise near the driver.
- If the ambient temperature of the driver exceeds the upper limit of the operating ambient temperature, revise the ventilation condition or forcibly cool the area around the driver using a fan in order to keep within the operating ambient temperature.

### Installing with screws

Install the driver perpendicularly (vertical position) and affix the driver through the mounting holes using two screws (M4: not supplied).
Mounting to DIN rail

When mounting the driver to a DIN rail, use a separately sold DIN rail mounting plate (model number: PADP03) and attach it to a 35 mm (1.38 in.) wide DIN rail.

1. Attach the DIN rail mounting plate (model number: PADP03) to the back of the driver using the screws supplied with the plate.
   Tightening torque: 0.3 to 0.4 N·m (2.6 to 3.5 lb-in)

2. Pull the DIN lever down, engage the upper tab of the DIN rail mounting plate over the DIN rail, and push the DIN lever until it locks in place.

3. Use an end plate (not supplied) to secure the driver.

Removing from DIN rail

Pull the DIN lever down until it locks using a flat tip screwdriver, and lift the bottom of the driver to remove it from the rail.
Use force of about 10 to 20 N (2.2 to 4.5 lb.) to pull the DIN lever to lock it. Excessive force may damage the DIN lever.

Note
- Do not use the mounting holes (M3, four locations) for the DIN rail mounting plate provided in the back of the driver for any purpose other than securing the DIN rail mounting plate.
- Be sure to use the supplied screws when securing the DIN rail mounting plate. The use of screws that would penetrate 3 mm (0.12 in.) or more through the surface of the driver may cause damage to the driver.
6.9 Installing the regeneration unit (sold separately)

Install the regeneration unit **EPRC-400P** (sold separately) in a location where heat dissipation capacity equivalent to a level achieved with a heat sink [made of aluminum, 350×350×3 mm (13.78×13.78×0.12 in.)] is ensured. Affix the **EPRC-400P** on a smooth metal plate offering high heat conductivity, using two screws (M4, not supplied).

6.10 Installing the external potentiometer (supplied)

Insert the external potentiometer as shown below.

Soldering the variable resistor terminal and the lead wires

Cover a heat-shrinkable tube over the soldered part to insulate. Soldering condition: 235 °C (455 °F), less than 5 sec.
6.11 Installing and wiring in compliance with EMC Directive

The BLE Series is designed and manufactured for use as an internal component of equipment. The EMC Directive require that your mechanical equipment in which the BLE Series is installed satisfy the applicable requirements. The installation/wiring methods of the motor and driver explained here represent the basic methods that are effective in helping your mechanical equipment conform to the EMC Directive. The final level of conformance of your mechanical equipment to the EMC Directive will vary depending on the control system equipment used with the motor/driver, configuration of electrical parts, wiring, layout, hazard level, and the like. Therefore, you must conduct the EMC tests on your mechanical equipment to confirm compliance.

Without effective measures to suppress the electromagnetic interference (EMI) caused by the BLE Series in the surrounding control system equipment or the electromagnetic spectrum (EMS) generated by the BLE Series, the function of your mechanical equipment may be seriously affected.

The BLE Series will conform to the EMC Directive if installed/wired using the methods specified below.

■ Connecting a mains filter

Install a mains filter in the power line in order to prevent the noise generated within the driver from propagating outside via the AC input line. For mains filters, use the products as shown in the chart, or an equivalent.

Overvoltage category II applies to mains filters. Install the mains filter as close to the driver as possible, and use cable clamps and other means to secure the input and output cables firmly to the surface of the enclosure. Connect the ground terminal of the mains filter to the grounding point, using as thick and short a wire as possible. Do not place the AC input cable (AWG18 to 14: 0.75 to 2.0 mm²) parallel with the mains-filter output cable (AWG18 to 14: 0.75 to 2.0 mm²). Parallel placement will reduce mains filter effectiveness if the enclosure’s internal noise is directly coupled to the power supply cable by means of stray capacitance.

■ Connecting the control power supply

Use a control power supply conforming to the EMC Directive. Use a shielded cable for wiring and wire/ground the control power supply over the shortest possible distance. Refer to “Wiring the power supply cable” for how to ground the shielded cable.

■ Grounding procedure

The cable used to ground the motor, driver, mains filter and power supply cable (shielded cable) must be as thick and short to the grounding point as possible so that no potential difference is generated. Choose a large, thick and uniformly conductive surface for the grounding point. Refer to the p.26 for the recommended grounding method.

■ Wiring the power supply cable

Use a shielded cable of AWG18 to 14 (0.75 to 2.0 mm²) in diameter for the driver power supply cable and keep it as short as possible. Strip a part of the shielded cable and ground the stripped part using a metal cable clamp that contacts the stripped cable around its entire circumference, or use a drain wire to make the ground connection. When grounding the shielded cable, connect both ends (mains filter side and power supply side) to earth to prevent a potential difference from generating in the shielded cable.

■ Notes about installation and wiring

- Connect the motor/driver and other peripheral control equipment directly to the grounding point so as to prevent a potential difference from developing between grounds.
- When relays or electromagnetic switches are used together with the system, use mains filters and CR circuits to suppress surges generated by them.
- Keep cables as short as possible without coiling and bundling extra lengths.
- Wire the power lines such as the motor cable and power cable away from the signal cables by providing a minimum clearance of 100 mm (3.94 in.) between them. If they must cross, do so at a right angle. Place the AC input cable and output cable of a mains filter separately from each other.
- Use a connection cable (supplied or sold separately) when extending the wiring distance between the motor and driver. The EMC measures are conducted using the Oriental Motor connection cable.

■ Precautions about static electricity
Static electricity may cause the driver to malfunction or become damaged. Do not come close to or touch the driver while the power is on except when operating the switch of the front of driver.
To change the settings of driver switches, be sure to use an insulated screwdriver.
This chapter explains how to connect the driver and motor, I/O signals, and power supply, as well as the grounding method.

### 7.1 Connection example

The connection example below shows an example of a electromagnetic brake type single-phase 100 to 120 V driver where the built-in power supply and supplied external potentiometer are used to set the speed. Refer to the applicable pages for details.

---

*1 Connection is not necessary if the built-in power supply is used.

*2 Connection is necessary only when using an electromagnetic brake motor.
7.2 Connecting the power supply

Use a grounding wire of AWG18 to 14 (0.75 to 2.0 mm²), and do not share the Protective Earth Terminal with a welder or any other power equipment.

When grounding the Protective Earth Terminal, use a round terminal and affix the grounding point near the driver.

Connect the motor cable to the motor connector (CN2) and motor signal connector (CN4) of the driver.

Insert the motor power connector into CN2, and the motor signal connector into CN4.

For the electromagnetic brake type, connect the connector for the electromagnetic brake to the CN1.

7.5 Connecting the regeneration unit

Use the regeneration unit EPRC-400P (sold separately) if gravitational operation or sudden starting/stopping of a large inertia load will be repeated frequently. Install the regeneration unit in a location where heat dissipation capacity equivalent to a level achieved with a heat sink [made of aluminum, 350×350×3 mm (13.78×13.78×0.12 in.)] is ensured.

Connection method

Connection to the I/O terminals varies depending on the connection method. Refer to p.35.

Connect the regeneration unit before turning on the main power. The regeneration unit does not perform its control function if connected after the main power has been turned on.

- Regenerative current flows through the two thick lead wires (AWG18: 0.75 mm$^2$) of the regeneration unit. Connect them to the RG1 and RG2 terminals of the TB1. The applicable crimp terminal is the same as the one used to connect the power supply. Refer to p.26.
- The two thin lead wires (AWG22: 0.3 mm$^2$) of the regeneration unit are thermostat outputs. Refer to p.29 for the connection method.

![Connection diagram]

Note

- If the current consumption of the regeneration unit exceeds the allowable level, the thermostat will be triggered and a regeneration unit overheat alarm will generate. If a regeneration unit overheat alarm generates, turn off the power and check the content of the error.
- When an external power supply is used for the power supply for input signals, turn on the external power supply before supplying the AC power to the driver.

7.6 Selecting the I/O signal power supply

Select the I/O signal power supply (built-in power supply or external power supply) to be used. The driver comes with a built-in power supply. To control the operation using relays and switches, set the external voltage selector switch SW2-1 to the ON side to select the built-in power supply.

Factory setting: OFF (an external power supply is used)

Note
- Change the setting of the external voltage selector switch SW2-1 before turning on the power.
- The built-in power supply cannot be used with the source logic. If the source logic is used, do not turn the external voltage selector switch to the ON position.

### Connecting input/output signals

The combination type connector is used for the input/output signal connection (CN5). The combination connector may be installed and removed with the lead wire connected, thereby offering better work efficiency for driver installation and maintenance.

1. Strip the lead wire and twist the cable conductor. 
   Applicable lead wire diameter: 
   AWG24 to 20 (0.2 to 0.5 mm²) 
   Length of the lead wire which can be peeled: 
   4 mm (0.16 in.)

2. Loosen the combination connector screw.

3. Insert the stripped cable conductor into the combination connector, and tighten the screw. 
   Use a 2 to 2.5 mm (0.079 to 0.098 in.) wide slotted head screwdriver. 
   Tightening torque: 0.22 to 0.25 N·m (1.94 to 2.2 lb-in)

### Input signal circuit

All input signals of the driver are photocoupler inputs. 
When an external power supply is used: 
24 VDC –15 to +20%, 100 mA or more

### Output signal circuit

The driver outputs signals are photocoupler/open-collector output.
The ON voltage of the output circuit is max. 1.6 V. When driving each element using the output signal circuit, give consideration to this ON voltage. 
4.5 to 30 VDC, 40 mA or less
(For the SPEED-OUT output, supply at least 5 mA of current.)

**Note**
- Be sure to use the current of the output signal at 40 mA or less. If the current exceeds this value, connect the current limiting resistor. If the power supply voltage is connected to the output circuit directly without connecting a current-limiting resistor in between, the driver will be damaged.
- When connecting a relay (inductive load), etc., to detect alarm outputs, use a relay with built-in flywheel diode, or provide a fly-back voltage control measure based on diode, etc., for the inductive load.
### Input signals
The signal state represents the “ON: Carrying current” or “OFF: Not carrying current” state of the internal photocoupler rather than the voltage level of the signal.

- **FWD input and REV input**
  When the FWD input is turned ON, the motor turns in the clockwise direction according to the time set by the acceleration time potentiometer. When the FWD input is turned OFF, the motor stops.
  When the REV input is turned ON, the motor turns in the counterclockwise direction according to the time set by the acceleration time potentiometer. When the REV input is turned OFF, the motor stops.
  If both the FWD input and REV input are turned ON, the motor stops instantaneously.

- **STOP-MODE input**
  Select how the motor should stop when the FWD input or REV input is turned OFF.
  When the STOP-MODE input is ON, the motor stops according to the time set by the deceleration time potentiometer.
  STOP-MODE input is OFF, the motor stops instantaneously.

- **M0 input**
  Select how the motor speed is set.
  When the M0 input is ON, the motor turns at the speed set by the external potentiometer or external DC voltage.
  When the M0 input is OFF, the motor turns at the speed set by the internal potentiometer.
  By switching the M0 input, the motor can be operated at two speeds through use of both the external potentiometer and internal potentiometer. Refer to p.42 for details.
  You can set a maximum of eight speeds by changing the assignments of M0 to M2 inputs using the **OPX-2A** or **MEXE02**.

- **ALARM-RESET input**
  This input actuates the driver’s protective function to reset present alarms.
  To reset each alarm, be sure to remove the cause of the alarm before switching the ALARM-RESET input.
  To reset an alarm, turn both the FWD input and REV input OFF, remove the cause of the alarm, and then turn the ALARM-RESET input ON (and keep it ON for 10 ms or more). The ALARM-RESET input will not be received if the FWD input or REV input is ON.
  If the alarm cannot be reset with the ALARM-RESET input, turn off the power, wait for at least 30 seconds, and then turn the power back on.

- **MB-FREE input**
  This input signal is used for the electromagnetic brake type. The operation mode of the electromagnetic brake at motor standstill is selected.
  When the MB-FREE input is ON, the electromagnetic brake will be released.
  When the MB-FREE input is OFF, the electromagnetic brake will actuate and hold the shaft in position.

- **TH input**
  When using the regeneration unit **EPRC-400P**, connect the thermostat output of the regeneration unit (normally closed).
### Output signals

The signal state represents the “ON: Carrying current” or “OFF: Not carrying current” state of the internal photocoupler rather than the voltage level of the signal.

#### SPEED-OUT output

30 pulses are output with each revolution of the motor output shaft synchronously with the motor operation. The pulse width of output pulse signals is 0.2 ms. You can use the SPEED-OUT output to calculate the motor speed.

\[
\text{SPEED-OUT output frequency (Hz)} = \frac{1}{T} \\
\text{Motor shaft speed (r/min)} = \frac{\text{SPEED-OUT output frequency}}{30} \times 60 \times 0.2 \text{ ms}
\]

#### ALARM-OUT1 output

When the driver’s protective function actuates, the ALARM-OUT1 output turns OFF and the ALARM LED blinks (normally closed). The motor coasts to a stop in the case of a standard type. When the motor is an electromagnetic brake type, the motor stops instantaneously and the electromagnetic brake is actuated to hold the shaft in position. To reset an alarm, turn both the FWD input and REV input OFF, remove the cause of the alarm, and then turn the ALARM-RESET input ON (and keep it ON for 10 ms or more). The ALARM-RESET input will not be received if the FWD input or REV input is ON. If the alarm cannot be reset with the ALARM-RESET input, turn off the power, wait for at least 30 seconds, and then turn the power back on.

#### Using a controller with a built-in clamp diode

If a controller with a built-in clamp diode is used, a leakage path may form and cause the motor to operate even when the controller power is off, as long as the driver power is on. Since the power capacity of the controller is different from that of the driver, the motor may operate when the controller and driver powers are turned on or off simultaneously. When powering down, turn off the driver power first, followed by the controller power. When powering up, turn on the controller power first, followed by the driver power.

8.2 Basic operation

- **Speed setting**
The setting range is 100 to 4000 r/min.

- **Setting by internal potentiometer**
  Use a precision screwdriver to turn the internal potentiometer. Turn the potentiometer clockwise to increase the speed.
  Factory setting: 0 r/min

- **Setting by the external potentiometer**
  Connect the supplied external potentiometer to the I/O signal connector (CN5) of the driver. Use the supplied signal wire [1 m (3.3 ft.)] for this connection. Ground the shielded wire of the signal wire. Make sure the shielded wire does not contact other terminals.
  When the M0 input is turned ON, the external potentiometer is enabled. Turn the potentiometer clockwise to increase the speed.

- **Setting with external DC voltage**
  Set either 5 or 10 VDC for the external DC voltage. Use the external voltage selector switch SW2-2 to set which voltage to be used. 5 VDC is set when the switch is set to the ON position, and 10 VDC is set when the switch is set to the OFF position.
  Factory setting: 5 VDC (ON)

**Note** Change the setting of the external voltage selector switch SW2-2 before turning on the power.

For the external voltage, use a DC power supply (0 to 5 VDC or 0 to 10 VDC) with reinforced insulation on both the primary side and secondary side, and use the supplied signal wire [1 m (3.3 ft.)] to connect it to the I/O signal connector (CN5).
Ground the shielded wire of the signal wire. Make sure the shielded wire does not contact other terminals.
The input impedance between the VM input and VL input is approx. 15 kΩ when SW2-2 is ON, and approx. 30 kΩ when OFF. The VL input is connected to IN-COM1 inside the driver.

**Note** Be sure to set the external DC voltage to either 5 VDC or less, or 10 VDC or less. When connecting the external DC power supply, make sure the polarities are correct. If the polarities are reversed, the driver may be damaged.
Running/stopping the motor

Run/stop the motor by inputting operation control signals.

Operation

When the FWD input is turned ON, the motor turns in the clockwise direction according to the time set by the acceleration time potentiometer. When the FWD input is turned OFF, the motor stops.

When the REV input is turned ON, the motor turns in the counterclockwise direction according to the time set by the acceleration time potentiometer. When the REV input is turned OFF, the motor stops.

If the FWD input and REV input are turned ON at the same time, the motor stops instantaneously.

Note

When using the motor in vertical drive (gravitational operation), although it depends on the load condition, if operation is performed with the setting below, the motor shaft may momentarily rotate in the reverse direction (about one-fourth revolution of the motor output shaft) at the time of starting/stopping the motor.

- When the set rotation speed is low
- When the acceleration time and deceleration time is long

Stop

Select how the motor should stop when the FWD input or REV input is turned ON.

When the STOP-MODE input is ON, the motor stops according to the time set by the deceleration time potentiometer.

STOP-MODE input is OFF, the motor stops instantaneously.

Rotating direction of the motor output shaft

The rotating direction of the motor output shaft represents the direction when viewed from the motor output shaft side.

Combination type parallel shaft gearhead

The rotating direction of the motor output shaft may vary from that of the gearhead output shaft depending on the gear ratio of the gearhead.

<table>
<thead>
<tr>

<tr>

</tr>
</tbody>
</table>
**Combination type hollow shaft flat gearhead**

For all gear ratios, the output shaft turns in the opposite direction to the motor as viewed from the front of the gearhead. The direction is different depending on whether the motor/gearhead assembly is viewed from the front side or rear side.

- **Viewed from Rear**

### 8.3 Setting the acceleration time and deceleration time

You can set the acceleration time and deceleration time separately for starting and stopping. The acceleration time and deceleration time are effective for all speed settings.

- **Setting the acceleration time**
  
  “Acceleration time” refers to the time needed to reach the rated speed (3000 r/min).
  Set the acceleration time using the acceleration time potentiometer (ACCEL). Turning the potentiometer clockwise increases the time.
  
  The setting range is 0.2 to 15 sec.
  Factory setting: 0.2 sec

- **Setting the deceleration time**
  
  “Deceleration time” refers to the time needed for the motor to stop from the rated speed (3000 r/min).
  Set the deceleration time using the deceleration time potentiometer (DECEL). Turning the potentiometer clockwise increases the time.
  
  The setting range is 0.2 to 15 sec.
  Factory setting: 0.2 sec

- **t1, t2 = 0.2 to 15 sec (3000 r/min)**

  “Acceleration time (t1)” refers to the time needed for the motor to reach the rated speed (3000 r/min) from the stationary state.
  “Deceleration time (t2)” refers to the time needed for the motor to stop from the rated speed (3000 r/min).
  The actual acceleration time and deceleration time vary depending on the conditions of use, load inertia, load torque, etc. If smooth acceleration operation or deceleration operation is not possible, increase the acceleration time or deceleration time.
8.4 Changing the speed

Operation can be performed at two speeds through use of both the internal potentiometer and external potentiometer (external DC voltage). When the M0 input is ON, the motor turns at the speed set by the external potentiometer or external DC voltage. When the M0 input is OFF, the motor turns at the speed set by the internal potentiometer.

8.5 Examples of operation patterns

The charts below are examples of setting the internal potentiometer to 3000 r/min and external potentiometer to 1000 r/min and switching the speed between these two levels.

**Note**
- Make sure each signal remains ON for at least 10 ms.
- When switching the FWD input and REV input, provide an interval of at least 10 ms.
If the FWD input and REV input are turned ON at the same time, the motor stops instantaneously regardless of the status of the STOP-MODE input.

8.6 Parallel operation

If two or more motors are to be operated at the same speed by using a single external potentiometer (external DC voltage), this type of operation is called “parallel operation.” Parallel operation is achieved by allowing multiple drivers to share the power line and speed setting line.

- The connection examples explained here assume a single-phase specification. In the case of a three-phase specification, connect the power line to a three-phase power supply.
- Connect the external I/O signals to each driver.
- To perform parallel operation using the external potentiometer, set the external voltage selector switch (SW2-2) to 5 VDC.
- Set the external voltage selector switch (SW2-2) the same way for all the drivers.

Using an external potentiometer

Connect the drivers as shown below.

When performing parallel operation using the external potentiometer, the number of drivers should not exceed 20 units.

If the number of drivers used is “n,” calculate resistance (VRx) of the external potentiometer using the formula below:

Resistance (VRx) = 20/n (kΩ), n/4 (W)

Example: If two drivers are used, resistance (VRx) is calculated as 10 kΩ, 1/2 W [20/2 (kΩ), 2/4 (W)].

(Use a resistor of the calculated wattage or more.)

If the speed will vary among the respective motors, make adjustments by connecting a resistor of 470 Ω, 1/4 W to terminal VM on driver 1 and connecting a variable resistor of 1 kΩ, 1/4 W to driver 2 and subsequent drivers.
Using external DC voltage

Connect the drivers as shown below.

If the number of drivers used is “n,” calculate the current capacity (I) of the external DC power supply using the formula below:

Current capacity (I) = 1 × n (mA)

Example: If two drivers are used, current capacity (I) is calculated as 2 mA or more [1 × 2 (mA)].

If the speed will vary among the respective motors, make adjustments by connecting a resistor of 470 Ω, 1/4 W to terminal VM on driver 1 and connecting a variable resistor of 1 kΩ, 1/4 W to driver 2 and subsequent drivers.

8.7 Setting the FBL II compatible mode and operation

In this mode, the settings switch to those identical to the FBL II Series.

Switch the mode using the FBL II compatible mode setting switch (SW1-2).

Note: Change the setting of the FBL II compatible mode setting switch (SW1-2) before turning on the main power supply. If the switch setting is changed after the main power supply has been turned on, the new setting does not become effective.

ON: The FBL II compatible mode is enabled.
OFF: The FBL II compatible mode is disabled (factory setting).

Details of FBL II compatible mode

The acceleration time and deceleration time vary depending on load.

10 Maintenance and inspection

10.1 Inspection

It is recommended that the items listed below be inspected regularly after motor operation. If any abnormality is found, stop using the motor and call our Technical Support Line.

**Note**
- Never measure insulation resistance or conduct a dielectric strength test with the motor and driver connected. Doing so may damage the motor/driver.
- The driver uses semiconductor elements, so handle it with due care. Electrostatic discharge can damage the driver.

**Inspection items**

Confirm that:
- The motor/gearhead mounting screws are not loose.
- The bearing (ball bearing) and other parts of the motor are not generating noise.
- The bearing (ball bearing) and gear meshing parts of the gearhead are not generating noise.
- The motor/gearhead output shaft is not misaligned with the load shaft.
- The cables are free from damage or stress and are securely connected to the driver.
- The openings in the driver are not blocked.
- The driver mounting screws and power connection terminal screws are not loose.
- The power elements and smoothing capacitors in the driver are not generating an abnormal smell or having abnormalities.

10.2 Warranty

Check on the Oriental Motor Website for the product warranty.

10.3 Disposal

Dispose the product correctly in accordance with laws and regulations, or instructions of local governments.
11 Protection function

When an alarm generates and the driver's protective function is actuated, the ALARM-OUT1 output will turn OFF.*
In the case of a standard type, the motor coasts to a stop, and then the holding power of the motor output shaft is lost.
When the motor is an electromagnetic brake type, the motor stops instantaneously and the electromagnetic brake is
actuated to hold the shaft in position.
The ALARM LED blinks at the same time. You can check the type of the alarm by counting the number of times the
ALARM LED blinks.

* ON in the FBL II compatible mode

Flashing pattern example: Sensor error (three flashes)

To reset an alarm, be sure to remove the cause of the alarm and then perform one of the following operations:
• Turn the ALARM-RESET input ON for at least 10 ms. (Refer to p.31 for details.)
• Turn off the power, wait for at least 30 sec, and then cycle the power.

**Note**
• Alarms cannot be reset if the FWD input or REV input is ON or the motor is running. Be sure to stop the motor before resetting any alarm.
• Alarms caused by damage to the motor or driver itself cannot be reset using the method explained above. Please contact your nearest office.
• Make sure the ALARM-RESET input remains ON for at least 10 ms. If the ON period is too short, the alarm may not be reset.
• If an external stop alarm generates, the motor stops instantaneously.

  - Review the wiring.
  - Change the signal cables to a shielded type.
  - Install ferrite cores.

### The motor doesn’t stop instantaneously.
- The STOP-MODE input is ON.
  - To cause the motor to stop instantaneously, turn OFF the STOP-MODE input.
- The inertial load is large.
  - Reduce the load inertia or connect the regeneration unit (sold separately) to check the inertial load.

- The MB-FREE input is ON.
  - Turn OFF the MB-FREE input.
