Oriental motor

ASTEP

AZ Series / Motorized Actuator equipped with AZ Series mini Driver

EtherNet/IP™ Compatible

USER MANUAL

Introduction

Hardware

Implicit communication

Parameter ID lists

Troubleshooting

Reference materials

Thank you for purchasing an Oriental Motor product.

This Manual describes product handling procedures and safety precautions.

- Please read it thoroughly to ensure safe operation.
- Always keep the manual where it is readily available.

1 Introduction

This part explains the product overview and safety precautions in addition to the types and descriptions about operating manuals.

◆Table of contents

1	Before using the product6		
2	Operating manuals	7	
	2-1 Related operating manu	uals7	
	2-2 How to use operating m	nanuals7	
3	Overview of the product	· · · · · · · · · · · · · · · · · · ·	
4	Safety precautions	10	
5	Precautions for use	12	

1 Before using the product

Only qualified personnel of electrical and mechanical engineering should work with the product. Use the product correctly after thoroughly reading the section "4 Safety precautions" on p.10. In addition, be sure to observe the contents described in warning, caution, and note in this manual.

The product described in this document has been designed and manufactured to be incorporated in general industrial equipment. Do not use for any other purpose. Oriental Motor Co., Ltd. is not responsible for any compensation for damage caused through failure to observe this warning.

2 Operating manuals

2-1 Related operating manuals

For operating manuals, download from Oriental Motor Website Download Page or contact your nearest Oriental Motor sales office.

- AZ Series / Motorized Actuator equipped with AZ Series mini Driver EtherNet/IP Compatible USER MANUAL (this document)
- AZ Series / Motorized Actuator equipped with AZ Series OPERATING MANUAL Function Edition

Read the following operating manuals for motors and motorized actuators.

- OPERATING MANUAL Motor Edition
- OPERATING MANUAL Actuator Edition
- Motorized Actuator OPERATING MANUAL Function Setting Edition

2-2 How to use operating manuals

To use the product, read this manual together with the **AZ** Series <u>OPERATING MANUAL Function Edition</u>. This manual describes contents specific to the mini Driver EtherNet/IP compatible, and the **AZ** Series <u>OPERATING MANUAL Function Edition</u> describes contents common to the **AZ** Series products. Refer to the **AZ** Series <u>OPERATING MANUAL Function Edition</u> for the contents not included in this manual. Reference destinations are indicated according to the flow of use.

■ How to read reference destinations

The title name of the operating manual is described in the reference destination.

The title number described in the reference destination may be changed. Use the title name when checking the reference destination.

- *1 When a motorized actuator is used, the following contents cannot be operated via EtherNet/IP. Use the support software **MEXEO2**.
 - Copying the fixed value (parameter) of the ABZO sensor to driver
 - Creation of recovery data file and method of recovery
- *2 Refer to this manual for "LEDs of the driver." (□ p.19)

■ Description of power supplies

This manual describes contents when a main power supply and a control power supply are used. The mini Driver can also be used with a main power supply only. When using it with only the main power supply, replace "main power supply and control power supply" or "control power supply" with "main power supply" to read this manual.

3 Overview of the product

The AZ Series mini Driver EtherNet/IP compatible is the dedicated driver for the AZ Series products.

■ Compact and light weight

Compact and lightweight are achieved, offering the dimensions of 69 mm \times 56 mm \times 30 mm (2.72 in. \times 2.2 in. \times 1.18 in.) and the mass of 0.11 kg (0.24 lb.).

■ Compatible with EtherNet/IP

Direct data operation can be started, and operation data and parameters can be set via Implicit communication (periodic communication) of EtherNet/IP.

Setting methods of operation data and parameters

Operation data and parameters can be set via EtherNet/IP or using the **MEXEO2** software. This manual describes how to set operation data and parameters via EtherNet/IP.

■ Equipped with direct data operation function

Direct data operation is a function to start operation at the same time as rewriting of the data. It can be used when the setting of the operation data is changed frequently, such as changing the speed or travel amount according to a load.

■ Providing the EDS File

The EDS file (Electronic Data Sheets file) is a file that describes the specific information of the EtherNet/IP compatible products. Importing the EDS file to the setting tool of the scanner can perform the settings of EtherNet/IP before the driver is delivered to you.

For details, contact your nearest Oriental Motor sales office.

4 Safety precautions

The precautions described below are intended to ensure the safe and correct use of the product, and to prevent the user and other personnel from exposure to the risk of injury. Use the product only after carefully reading and fully understanding these instructions.

∆WARNING	Handling the product without observing the instructions that accompany a "WARNING" symbol may result in serious injury or death.
△CAUTION	Handling the product without observing the instructions that accompany a "CAUTION" symbol may result in injury or property damage.
Note	The items under this heading contain important handling instructions that the user should observe to ensure safe use of the product.
memo	The items under this heading contain related information and contents to gain a further understanding of the text in this manual.

MARNING

General

- Do not use the product in explosive or corrosive environments, in the presence of flammable gases, in places subjected to splashing water, or near combustibles. Doing so may result in fire, electric shock, or injury.
- Assign qualified personnel to the task of installing, wiring, operating/controlling, inspecting and troubleshooting
 the product. Handling by unqualified personnel may result in fire, electric shock, injury, or damage to equipment.
- Do not transport, install, connect or inspect the product while the power is supplied. Doing so may result in electric shock.
- Do not touch the driver while the power is supplied. Doing so may result in fire or electric shock.
- When an alarm of the driver is generated (any of the driver's protective functions is triggered), remove the cause before resetting the alarm (protective function). Continuing the operation without removing the cause of the problem may cause malfunction of the motor and the driver, leading to injury or damage to equipment.

Installation

• Install the driver in an enclosure. Failure to do so may result in electric shock or injury.

Connection

- Observe the product specifications for the power supply voltage of the driver. Failure to do so may result in fire or electric shock.
- Connect the product securely according to the connection diagram. Failure to do so may result in fire or electric shock.
- Do not forcibly bend, pull, or pinch the connection cable. Doing so may result in fire or electric shock.

Operation

- Turn off the main power supply and the control power supply in the event of a power failure. Failure to do so may result in injury or damage to equipment.
- Do not remove the motor excitation during operation. Doing so may cause the motor to stop and lose the holding force, resulting in injury or damage to equipment.

Repair, disassembly, and modification

• Do not disassemble or modify the driver. Doing so may result in injury or damage to equipment.

^CAUTION

General

- Do not use the driver beyond the specifications. Doing so may result in electric shock, injury, or damage to equipment.
- Keep your fingers and objects out of the openings in the driver. Failure to do so may result in fire, electrical shock, or injury.
- Do not touch the driver during operation or immediately after stopping. Doing so may result in a skin burn(s).
- Do not forcibly bend or pull the cable that is connected to the driver. Doing so may cause damage to the product.

Installation

- Keep the area around the driver free of combustible materials. Failure to do so may result in fire or a skin burn(s).
- Do not leave anything around the driver that would obstruct ventilation. Doing so may result in damage to equipment.

Operation

- Use a motor and a driver only in the specified combination. An incorrect combination may cause a fire.
- Take measures against static electricity when operating the switches of the driver. Failure to do so may result in the driver malfunction or damage to equipment.
- Provide an emergency-stop device or emergency-stop circuit external to the equipment so that the entire equipment will operate safely in the event of a system failure or malfunction. Failure to do so may result in injury.
- When moving the moving part manually, put the motor into a non-excitation state. Continuing the work while the motor is in an excitation state may result in injury.
- For the main power supply and the control power supply, use a DC power supply with reinforced insulation on its primary and secondary sides. Failure to do so may result in electric shock.
- When an abnormal condition has occurred, immediately stop operation to turn off the main power supply and control power supply. Failure to do so may result in fire, electrical shock or injury.

5 Precautions for use

This chapter explains restrictions and requirements the user should consider when using the product.

Always use Oriental Motor cables to connect a motor and a driver.

Refer to the cable models on p.34.

 When conducting the insulation resistance measurement or the dielectric strength test, be sure to separate the connection between the motor and the driver.

Conducting the insulation resistance measurement or the dielectric strength test with the motor and driver connected may result in damage to the product.

Note when connecting a main power supply and a control power supply in a state of grounding the
positive side

The USB connector on the driver is not electrically insulated. When grounding the positive terminals of a main power supply and a control power supply, do not connect any equipment (PC, etc.) whose negative terminal is grounded. Doing so may cause the driver and this equipment to short, damaging both. When connecting, do not ground equipment.

Saving data to the non-volatile memory

Do not turn off the main power supply and control power supply while writing the data to the non-volatile memory, and also do not turn off for 5 seconds after the completion of writing the data. Doing so may abort writing the data and cause an alarm of EEPROM error to generate. The non-volatile memory can be rewritten approximately 100,000 times.

Noise elimination measures

Refer to p.27 for noise elimination measures.

Regeneration

When operating a large load inertia at a high speed, the regenerative energy generated may increase the voltage of the main power supply, causing an alarm of Overvoltage to generate. To prevent damage to the driver, reconsider the operating conditions so that regenerative voltage does not generate.

■ Notes when the connection cable is used

Note the following points when an Oriental Motor cable is used.

When inserting the connector

Hold the connector main body, and insert it in straight securely. Inserting the connector in an inclined state may result in damage to terminals or a connection failure.

When pulling out the connector

Pull out the connector in straight while releasing the lock part of the connector. Pulling out the connector with holding the cable may result in damage to the connector.

Bending radius of cable

• Use the cable in a condition where the bending radius of the cable is as follows.

Cable type: More than 6 times the cable diameter Connector type: More than 2.8 times the cable diameter

• Do not bend the lead wires part or secure with a clamp, etc. Doing so may result in damage to the connector.

Cable type: More than 6 times the cable diameter
Connector type: More than 2.8 times the cable diameter

• How to fix the cable

Fix the cable at two places near the connectors as shown in the figure or fix it with a wide clamp to take measures to prevent stress from being applied to the connectors.

2 Hardware

This part explains names and functions of each part of the driver, installation and connection methods, and so on.

	4-3	and the control power supply (CN1) 24 Connecting the EtherNet/IP cable		7-1	Connection cables (For cable type)34
	4-3	(CN3, CN4)26		7-2	Connection cables (For connector type)37
	4-4	Connecting the USB cable26		7-3	Power supply cable

1 System configuration

- *1 Connecting the control power supply allows you to continue monitoring even if the main power supply is shut off. Connect it as necessary.
- *2 It is recommended that a circuit breaker or a circuit protector is connected because incorrect wiring of the power supply may cause the internal input circuit to short-circuit.
- *3 Connect when using direct inputs or sensors.

2 Preparation

This chapter explains the items you should check, as well as names and functions of each part.

2-1 Checking the product

Verify that the items listed below are included. Report any missing or damaged items to the Oriental Motor sales office from which you purchased the product.

- Driver 1 unit
- Instructions and Precautions for Safe Use 1 copy

2-2 How to identify the product model

Check the driver model against the model shown on the nameplate. Refer to "2-4 Information about nameplate" on p.18 for how to identify the nameplate.

$$\frac{\mathbf{AZD}}{1} - \frac{\mathbf{K}}{2} \frac{\mathbf{R}}{3} \frac{\mathbf{EP}}{4}$$

1	Series	AZD: AZ Series driver
2	Power supply input	K : DC power input
3	Driver figure	R: Compact
4	Туре	EP : EtherNet/IP

2-3 Products possible to combine

Products with which the driver can be combined are listed below. Check the model name of the product with the nameplate.

Power supply type	Product type	Applicable Series	Model name representing Series name *1	Example of model name
	Stepping Motor	AZ Series	AZM	AZM46AK
	Motorized actuator	EAC Series *2	EACM	EACM2E05AZAK
		EAS Series *2	EASM	EASM4NXD005AZAK
		EZS Series *2	EZSM	EZSM6D005AZAK
DC power		DR Series	DR	DR28G2.5B03-AZAKU
input		DRS2 Series	DRSM	DRSM60-05A4AZAK
		DGII Series *2	DGM DGB DGR	DGM85R-AZAK DGB85R12-AZAKR DGR85R36-AZAKHR
		EH Series *2	EH	EH4-AZAKH
		L Series *2	LM	LM4F150AZAK-1

^{*1} The driver described in this manual can be combined with products that begin with these model names.

EAC Series, **EAS** Series, **EZS** Series: Check with the motor nameplate.

DGII Series, EH Series, L Series: Check with "P/N (Motor P/N)" described on the actuator nameplate.

^{*2} For these motorized actuators, the equipped motors have been evaluated to affix the CE Marking. The model name of the equipped motor can be checked as follows..

2-4 Information about nameplate

The figure shows an example.

2-5 Names and functions of parts

Туре	Name	Sign	Description
	PWR/ALM LED (Green/Red/ Blue)	PWR/ALM	This LED indicates the status of the driver.
LFD	MS LED (Green/Red)	MS	This LED indicates the status of the driver.
LED	NS LED (Green/Red)	NS	This LED indicates the communication status of EtherNet/IP.
	L/A LED (Green)	L/A	This LED indicates the LINK/ACT status of EtherNet/IP.
Switch	IP address setting switch	IP ADDR ×1	Sets the IP address. Factory setting: 0 (×1: 0)
	Power supply connector (CN1)	+, -	Connects a main power supply and a control power supply.
	Motor/encoder/ electromagnetic brake connector (CN2)	_	Connects the motor, the encoder, and the electromagnetic brake.
Connector	USB connector	•<	Connects a PC in which the MEXEO2 software has been installed. (USB2.0 mini-B port)
	EtherNet/IP connectors (CN3, CN4)	-	Connects the EtherNet/IP cable.
	Input signals connector (CN5)	_	Connects when using direct inputs or sensors.

2-6 Indication of LEDs

■ PWR/ALM LED

This LED indicates the status of the driver.

LED status	Description
No light	The main power supply and the control power supply are not turned on.
Green light	The main power supply and/or the control power supply are turned on.
Blinking red	An alarm is being generated. The alarm message generated can be checked by counting the number of times the LED blinks. The LED is lit in green when the alarm is reset.
Blinking blue	• Information is being generated. The LED is lit in green when the information is cleared.
billiking blue	• Remote operation is being executed with the MEXEO2 software. The LED is lit in green when remote operation is completed.
Repeating "Green \rightarrow Red \rightarrow Simultaneously lit * \rightarrow No light"	This is the driver simulation mode.

^{*} Green and red colors may overlap and it may be visible to orange.

■ MS LED

This LED indicates the status of the driver.

LED status		Description		
Green	Red	Description		
No light	No light	The main power supply and the control power supply of the driver are not turned on.		
Blinking No light The communication setting of EtherNet/IP is invalid.		The communication setting of EtherNet/IP is invalid.		
Light	No light	The driver operates properly.		
No light	nt Blinking	• An alarm that can be reset with EtherNet/IP or the MEXE02 software was generated.		
ino light		• The setting of an IP address is duplicated in the same system.		
No light Light		An alarm that cannot be reset with EtherNet/IP or the MEXEO2 software was generated.		
Blinking alternately		Self-diagnosis when turning on the power is executing.		

The blinking state of the LED is as follows.

■ NS LED

This LED indicates the communication status of EtherNet/IP.

LED status		Description	
Green	Red	Description	
NI - 1: - 1- 4	NI - II - I- 4	• This is in an offline state.	
No light	No light	• The main power supply and the control power supply of the driver are not turned on.	
Blinking	No light	This is in an online state. Connection has not been established with the scanner.	
Light No light		This is in an online state. Connection is being established with the scanner.	
No light Blinking		Connection timed out with the scanner.	
No light Light		The setting of an IP address is duplicated in the same system.	
Blinking alternately		Self-diagnosis when turning on the power is executing.	

The blinking state of the LED is as follows.

■ L/A LED

This LED indicates the LINK/ACT status of EtherNet/IP.

LED status	Description
No light	• This is in an offline state.
No light	• The frame of EtherNet/IP is not sent and received.
Dlinking	• This is in an online state.
Blinking	• The frame of EtherNet/IP is sent and received.
Limbt	• This is in an online state.
Light	• The frame of EtherNet/IP is not sent and received.

3 Installation

This chapter explains the installation location and installation method of the driver.

3-1 Installation location

The driver is designed and manufactured to be incorporated in equipment. Install it in a well-ventilated location that provides easy access for inspection. The location must also satisfy the following conditions:

- Inside an enclosure that is installed indoors (provide vent holes)
- Operating ambient temperature: 0 to +50 °C [+32 to 122 °F] (non-freezing)
- Operating ambient humidity: 85 % or less (non-condensing)
- Area free of explosive atmosphere, toxic gas (such as sulfuric gas), or liquid
- Area not exposed to direct sun
- Area free of excessive amount of dust, iron particles or the like
- Area not subject to splashing water (rain, water droplets), oil (oil droplets) or other liquids
- · Area free of excessive salt
- Area not subject to continuous vibration or excessive shocks
- Area free of excessive electromagnetic noise (from welders, power machinery, etc.)
- Area free of radioactive materials, magnetic fields or vacuum
- Up to 1,000 m (3,300 ft.) above sea level

3-2 Installation method

The driver can be installed in any direction.

Install the driver onto a flat metal plate offering high heat conductivity [material: aluminum, $150 \times 150 \times 2$ mm (5.91×5.91×0.08 in.) or equivalent].

When installing the driver, use the mounting holes and the cutouts for mounting to secure on the metal plate with two screws (M3: not included).

- Install the driver in an enclosure.
- Do not install any equipment that generates a large amount of heat or noise near the driver.
- Do not install the driver underneath a scanner or equipment vulnerable to heat.
- If the ambient temperature of the driver exceeds 50 °C (122 °F), reconsider the ventilation conditions such as providing forced cooling by using fans.

■ Dimensions [Unit: mm (in.)]

Mass: 0.11 kg (0.24 lb.)

4 Connection

This chapter explains a connection example of a driver and a motor, connection methods of a main power supply and a control power supply, and so on.

It also explains installation and wiring methods to conform to the EMC Directive/Regulations as well as measures against electrical noise.

4-1 Connection example

The figure shows an example when the **AZM14** motor is connected.

- *1 It is an Oriental motor cable. Purchase is required separately.
- *2 Connecting the control power supply allows you to continue monitoring even if the main power supply is shut off. Connect it as necessary.
- *3 It is recommended that a circuit breaker or a circuit protector is connected because incorrect wiring may cause the internal input circuit to short-circuit.

- Connect the connectors securely. Insecure connections may cause malfunction or damage to the motor or the driver.
- When connecting the cables, secure them so that no load is applied to the connectors. Applying a load to the connector may result in a connection failure, causing the driver to malfunction.
- Keep 10 m (32.8 ft.) or less for the wiring distance between a motor and a driver. Exceeding 10 m (32.8 ft.) in the wiring distance may result in increase of the electrical noise emitted from the driver.
- Keep 2 m (6.6 ft.) or less for the cable length of the main power supply and control power supply cables.

memo)

- Before connecting or disconnecting a connector, turn off the main power supply and the control power supply, and check the PWR/ALM LED has been turned off.
- When disconnecting the connector, pull out while pressing the latches on the connector with fingers.

4-2 Connecting the main power supply and the control power supply (CN1)

Connect a main power supply to the CN1 connector.

Connecting the control power supply allows you to continue monitoring even if the main power supply is shut off. Connect it as necessary.

Make sure the polarity of the power supply before connecting. Reverse-polarity connection may cause damage to the driver.

■ Applicable connector

Туре	Part number	Applicable lead wire
Connector housing	1-1827864-2 (TE Connectivity)	AWG22 (0.34 to 0.37 mm ²) AWG20 (0.51 to 0.53 mm ²)
Contact	1827589-2 (TE Connectivity)	AWG18 (0.85 to 0.87 mm²) Lead wire insulation outer diameter: Ø1.4 to 2.2 mm (Ø0.055 to 0.087 in.)
Designated crimp tool	2119142-1 (TE Connectivity)	Lead wire insulation strip length: 1.7 to 2.3 mm (0.067 to 0.091 in.)

■ Pin assignment

The figure shows the view from the insertion side of contacts.

Pin No.	Name	Description
A1	GND	Ground for control power supply
A2	GND	Ground for main power supply
B1	Control power supply	+24 VDC / +48 VDC
B2	Main power supply	+24 VDC / +48 VDC

A1 and A2 are not electrically insulated.

■ Voltage specifications

The voltage specifications of power supply input include the rated voltage and the allowable operating voltage. The voltage specifications are common for the main power supply and the control power supply.

Rated voltage	24 VDC±5 % 48 VDC±5 %
Allowable operating voltage	24 VDC input: 20 to 32 VDC (22.8 to 32 VDC) * 48 VDC input: 40 to 55 VDC

^{*} The value in parentheses () is the one when the electromagnetic brake motor is connected.

Set the "Main power mode" parameter to "0: 24 VDC" or "1: 48 VDC" when the main power supply starts up slowly or the voltage of the main power supply is unstable. (□ p.83)

■ Internal input circuit

The driver can be used with the main power supply and control power supply, or with the main power supply only. When using only the main power supply, the power is supplied from the main power supply to the control power supply circuit inside the driver.

■ Power supply current capacity

• Current capacity for main power supply

The current capacity for the main power supply varies depending on the product combined.

Check the current capacity in reference to the equipped motor model when using the **EAC** Series, **EAS** Series, or **EZS** Series.

The box (\square) in the model indicates an alphabet (**B**, **M**, or **R**) representing the shape of the actuator.

Series	Model	Rated voltage	Power supply current capacity	
	AZM14		0.4 A or more	
	AZM15	24 VDC±5 %	0.5 A or more	
AZ Series	AZM24, AZM26		1.4 A or more	
EAC Series EAS Series	AZM46		1.6 A or more	
EZS Series	AZM48	24 VDC±5 %	2.1 A or more	
	AZM66	48 VDC±5 %	3.7 A or more	
	AZM69		3.5 A or more	
	DG□60	24 VDC±5 %	1.4 A or more	
DGII Series	DG□85	24 VDC±5 % 48 VDC±5 %	1.6 A or more	
	DG□130		3.7 A or more	
DR Series	DR20	24 VDC±5 %	0.4 A or more	
DK Series	DR28	24 VDC±3 %	2.1 A or more 3.7 A or more 3.5 A or more 1.4 A or more 1.6 A or more 3.7 A or more 0.4 A or more 1.3 A or more 1.5 A or more 2.6 A or more 0.4 A or more	
DRS2 Series	DRSM42	24 VDC±5 %	1.5 A or more	
DR32 Series	DRSM60	48 VDC±5 %	2.6 A or more	
EH Series	EH3	24 VDC±5 %	0.4 A or more	
En series	EH4	24 VDC±3 %	1.4 A or more	
L Series	LM2, LM4	24 VDC±5 % 48 VDC±5 %	3.7 A or more	

• Current capacity for control power supply

Dated voltage	Power supply current capacity		
Rated voltage	Without electromagnetic brake	With electromagnetic brake	
24 VDC±5 % 48 VDC±5 %	0.15 A	0.4 A 30*	

^{*} The **AZM46** type is 0.23 A.

4-3 Connecting the EtherNet/IP cable (CN3, CN4)

Connect the EtherNet/IP cable to the EtherNet/IP connector (CN3, CN4).

■ Pin assignment

Signal name	Description
TXP	Transmitted data +
TXN	Transmitted data –
RXP	Received data +
N.C.	_
N.C.	-
RXN	Received data –
N.C.	-
N.C.	_

4-4 Connecting the USB cable

Using a USB cable of the following specifications, connect a PC in which the **MEXEO2** software has been installed to the USB connector.

Specifications	USB2.0 (full speed)	
Cable	Length: 3 m (9.8 ft.) or less Shape: A to mini B	

- Connect the driver and a PC directly using a USB cable.
- In large electrically noisy environments, use the USB cable with a ferrite core or install a ferrite core to the USB cable.

4-5 Connecting input signals (CN5)

Connect when using direct inputs or sensors.

■ Applicable lead wire and terminal

Applicable lead wire	• AWG26 to 20 (0.14 to 0.5 mm ²)
	• Lead wire strip length: 6 mm (0.24 in.)
Applicable ferrule terminal	Without sleeve: 0.25 to 0.5 mm ² With sleeve: 0.25 to 0.34 mm ²

■ Pin assignment

Pin No. Signal name		Description *	
1	IN0+	Control input 0 (STOD)	
2	INO-	Control input 0 (STOP)	
3	IN1+	Control input 1 (FREE)	
4	IN1-	Control iliput 1 (FREE)	

^{* ():} Initial value

■ Connection example with a current sink output circuit

^{*} Values in parentheses () are initial values.

■ Connection example with a current source output circuit

* (): Initial value

4-6 Noise elimination measures

There are two types of electrical noises: One is a noise to invade into the driver from the outside and cause the driver malfunction, and the other is a noise to emit from the driver and cause peripheral equipment malfunction. For the noise that is invaded from the outside, take measures to prevent the driver malfunction. It is needed to take adequate measures because signal lines are very likely to be affected by the noise. For the noise that is emitted from the driver, take measures to suppress it.

■ Measures against electrical noise

There are the following three methods mainly to take measures against the electrical noise.

Noise suppression

- When relays or electromagnetic switches are used, use noise filters or CR circuits to suppress surge generated by them.
- Use an Oriental Motor connection cable when extending the wiring distance between the motor and the driver. Refer to p.34 for the model name. This is effective in suppressing the electrical noise emitted from the motor.
- Cover the driver by a metal plate such as aluminum. This is effective in shielding the electrical noise emitted from the driver.

• Prevention of noise propagation

- Connect a noise filter on the input side of the DC power supply.
- Place the power lines, such as the motor and power supply cables, keeping a distance of 200 mm (7.87 in.) or more from the signal lines, and also do not bundle them or wire them in parallel. If a power cable and a signal cable have to cross, cross them at a right angle.
- Use shielded twisted pair cables for power lines and signal lines.
- Keep cables as short as possible without coiling and bundling extra lengths.
- Grounding multiple points will increase effect to block electrical noise because impedance on the grounding
 points is decreased. However, ground them so that a potential difference does not occur among the grounding
 points.
- To ground a shielded cable, use a metal cable clamp that can maintain contact with the entire circumference of the shielded cable, and ground as near the product as possible.

Suppression of effect by noise propagation

• Loop the noise propagated cable around a ferrite core. Doing so will prevent the propagated noise invades into the driver or emits from the driver. The frequency band in which an effect by the ferrite core can be seen is generally 1 MHz or more. Check the frequency characteristics of the ferrite core used. When increasing the effect of noise attenuation by the ferrite core, loop the cable a lot.

4-7 Conformity to EMC Directive/Regulations

Effective measures must be taken against EMI that the motor and driver may give to adjacent control-system equipment, as well as EMS of the motor and driver itself, in order to prevent a serious functional impediment in the machinery. The use of the following installation and wiring methods will enable the motor and driver to be compliant with EMC Directive/Regulations.

Oriental Motor conducts EMC testing on its motors and drivers in accordance with "Example of installation and wiring" on p.29. The user is responsible for ensuring the machine's compliance with EMC, based on the installation and wiring explained below.

This equipment is not intended for use in residential environments nor for use on a low-voltage public network supplied in residential premises, and it may not provide adequate protection to radio reception interference in such environments.

• Connecting the main power supply and the control power supply

Use DC power supplies compliant with EMC Directive/Regulations for the main power supply and the control power supply. Use shielded cables to wire and ground as short as possible. Refer to "Prevention of noise propagation" for how to ground the shielded cable.

Ferrite core

Install the following ferrite core (or equivalent) to the places shown in "Example of installation and wiring" on p.29. Part No.: ZCAT3035-1330 (TDK Corporation)

Connecting the motor cable

Use an Oriental Motor connection cable when extending the wiring distance between the motor and the driver. Refer to p.34 for the model name.

Connecting the signal cable

Refer to "Prevention of noise propagation."

How to ground

- Wires used to ground the motor must be as thick and short as possible so that no potential difference is generated between the grounding points.
- Choose a large, thick and uniformly conductive surface for the grounding point.

• Example of installation and wiring

The figure shows an example when the cable type electromagnetic brake motor is used.

- *1 The driver is grounded by making the heat sink contact directly with the grounded panel.
- *2 An Oriental Motor cable is used.

- The driver uses components that are sensitive to static electricity. Take measures against static electricity since static electricity may cause the driver to malfunction or suffer damage.
- When connecting the following products, cover the motor cable with a shielded braided sleeving. Use the cable clamps to ground both ends of the shielded braided sleeving.
 - AZ Series: AZM14, AZM15, AZM24, AZM26
 - EAC Series: EACM2
 EAS Series: EASM2
 DR Series: DR20, DR28
 DGII Series: DGM60, DGR60

- EH Series: EH3, EH4

5 Setting of IP address

The IP address, subnet mask, and default gateway are configured respectively as follows.

5-1 Setting method of IP address

The following three methods can be used to set the IP address, subnet mask, and default gateway.

	Set item		Specific setting method		
Setting method	IP address setting switch	"Configuration Control" parameter	IP address	Subnet mask	Default gateway
IP address setting switch	1 to E	0 *	First octet to third octet: Parameter Forth octet: IP address setting switch	Parameter	Parameter
	F	0 *	192.168.1.1	255.255.255.0	0.0.0.0
Parameter	0	0	Parameter	Parameter	Parameter
DHCP server	0	2	DHCP server	DHCP server	DHCP server

^{*} If the IP address setting switch is other than "0," the "Configuration Control" parameter is automatically set to "0: Parameter."

5-2 When using the IP address setting switch

■ Setting of IP address

Set the first octet to third octet with the parameters. Set the forth octet with the IP address setting switch.

• First octet to third octet

Related parameters

Parameter name	Description	Setting range	Initial value
IP Address 1	Sets the first octet of the IP address.		192
IP Address 2	Sets the second octet of the IP address.	0 to 255	168
IP Address 3	Sets the third octet of the IP address.		1

Fourth octet

Set the fourth octet of the IP address using the IP address setting switch (IP ADDR \times 1).

The setting range of the IP address setting switch is 1 to 14 (Eh).

The IP address setting switch is hexadecimal. Convert the IP address from decimal to hexadecimal to set.

Factory setting: 0 (Setting of parameter or DHCP server is enabled)

Setting example

Setting of switch	Value of IP address	Note
0	The setting of the parameter or DHCP server is enabled.	Whether either the parameter or the DHCP server is enabled can be checked with the "Configuration Control" parameter.
1	XXX.XXX.XXX.1	The fourth octet is set to "1."
Е	XXX.XXX.XXX.14	The fourth octet is set to "14."
F	192.168.1.1	This value is applied regardless of the setting of the parameter or the DHCP server.

- When setting the switch, turn on the main power supply and the control power supply again. The
 new setting is enabled when the main power supply and the control power supply are turned on
 again.
- When connecting two or more EtherNet/IP compatible products, set so that an IP address is not duplicated. If an IP address is duplicated, a communication error of the "IP address conflict" is detected.

■ Setting of subnet mask and default gateway

Set the subnet mask and default gateway with the parameters.

Related parameters

Parameter name	Description	Setting range	Initial value
Network Mask 1	work Mask 1 Sets the first octet of the subnet mask.		255
Network Mask 2 Sets the second octet of the subnet mask.		0 to 255	255
Network Mask 3	Sets the third octet of the subnet mask.	0 10 255	255
Network Mask 4	twork Mask 4 Sets the fourth octet of the subnet mask.		0
Gateway Address 1 Sets the first octet of the default gateway.		0 to 255	0
Gateway Address 2 Sets the second octet of the default gateway.			0
Gateway Address 3 Sets the third octet of the default gateway.			0
Gateway Address 4 Sets the fourth octet of the default gateway.			0

When the switch is set to "F," the following values are applied regardless of the setting of the parameter or the DHCP server.

- Subnet mask: 255.255.255.0
- Default gateway: 0.0.0.0

5-3 When setting with parameters

Set the IP address setting switch of the driver to "0" and the "Configuration Control" parameter to "0: Parameter." The parameters and the DHCP server cannot be used in combination.

Related parameters

Parameter name	Description	Setting range	Initial value
Configuration Control	Sets how to obtain the IP address.	0: Parameter 2: DHCP server	2
IP Address 1	Sets the first octet of the IP address.		192
IP Address 2	Sets the second octet of the IP address.	0 to 255	168
IP Address 3	Sets the third octet of the IP address.	0 10 233	1
IP Address 4	Sets the fourth of the IP address.		1
Network Mask 1	Sets the first octet of the subnet mask.		255
Network Mask 2	Sets the second octet of the subnet mask.	0 to 255	255
Network Mask 3	Sets the third octet of the subnet mask.		255
Network Mask 4	Sets the fourth octet of the subnet mask.		0
Gateway Address 1	Sets the first octet of the default gateway.		0
Gateway Address 2	Sets the second octet of the default gateway.	0 to 255	0
Gateway Address 3	Sets the third octet of the default gateway.	0 10 255	0
Gateway Address 4	Sets the fourth octet of the default gateway.		0

When connecting two or more EtherNet/IP compatible products, set so that an IP address is not duplicated. If an IP address is duplicated, a communication error of the "IP address conflict" is detected.

5-4 When setting with DHCP server

The IP address, subnet mask and default gateway are automatically assigned from the DHCP server. Set the IP address setting switch of the driver to "0" and the "Configuration Control" parameter to "2: DHCP server." The parameters and the DHCP server cannot be used in combination.

If the main power supply and the control power supply is shut off, the IP address obtained from the DHCP server is cleared.

Related parameter

Parameter name	Description	Setting range	Initial value
Configuration Control	Sets how to obtain the IP address.	0: Parameter 2: DHCP server	2

6 Inspection and maintenance

6-1 Inspection

It is recommended that periodic inspections are conducted for the items listed below after each operation of the motor. If any failure is found, discontinue any use and contact your nearest office.

■ Inspection item

- Check if the openings in the driver are clogged.
- Check if the installation place of the driver is loose.
- Check if any of the connection parts of the driver is loose.
- Check if dust is deposited on the driver.
- Check if the driver has unusual smells or appearance defects.

The driver uses semiconductor components. Static electricity may damage the semiconductor components of the driver, so be extremely careful when handling them.

6-2 Warranty

Check on the Oriental Motor Website for the product warranty.

6-3 Disposal

Dispose the product correctly in accordance with laws and regulations, or instructions of local governments.

7 Cable

7-1 Connection cables (For cable type)

■ Connection cables/Flexible connection cables (For AZM14, AZM15, AZM24, AZM26)

These cables are used when connecting a motor and a driver.

(memo) When installing the motor on a moving part, use a flexible cable.

Connection cables For motor/encoder

Model	Length [m (ft.)]
CCM005Z2AAF	0.5 (1.6)
CCM010Z2AAF	1 (3.3)
CCM030Z2AAF	3 (9.8)
CCM050Z2AAF	5 (16.4)
CCM100Z2AAF	10 (32.8)

Flexible connection cables For motor/encoder

Model	Length [m (ft.)]
CCM005Z2AAR	0.5 (1.6)
CCM010Z2AAR	1 (3.3)
CCM030Z2AAR	3 (9.8)
CCM050Z2AAR	5 (16.4)
CCM100Z2AAR	10 (32.8)

■ Connection cables/Flexible connection cables (For AZM46, AZM48, AZM66, AZM69)

These cables are used when connecting a motor and a driver.

The figure shows an example when the electromagnetic brake motor is used.

memo

When installing the motor on a moving part, use a flexible cable.

Connection cables

For motor/encoder

[m (ft.)]
0.5 (1.6)
1 (3.3)
3 (9.8)
5 (16.4)
10 (32.8)

$For \ motor/encoder/electromagnetic \ brake$

Model	Length [m (ft.)]
CCM005Z2ACF	0.5 (1.6)
CCM010Z2ACF	1 (3.3)
CCM030Z2ACF	3 (9.8)
CCM050Z2ACF	5 (16.4)
CCM100Z2ACF	10 (32.8)

• Flexible connection cables

For motor/encoder

Model	Length [m (ft.)]
CCM005Z2ABR	0.5 (1.6)
CCM010Z2ABR	1 (3.3)
CCM030Z2ABR	3 (9.8)
CCM050Z2ABR	5 (16.4)
CCM100Z2ABR	10 (32.8)

For motor/encoder/electromagnetic brake

Model	Length [m (ft.)]
CCM005Z2ACR	0.5 (1.6)
CCM010Z2ACR	1 (3.3)
CCM030Z2ACR	3 (9.8)
CCM050Z2ACR	5 (16.4)
CCM100Z2ACR	10 (32.8)

■ Extension cables/Flexible extension cables

These cables are used when extending a connection cable (add between the driver and connection cable). Use if the length of the connection cable used is not enough when extending the distance between a motor and a driver.

The extension cables and the flexible extension cables are common to all motors.

The figure shows an example when the **AZM14** motor is connected.

* Use the connection cable used.

- When installing the motor on a moving part, use a flexible cable.
- When extending the wiring length by connecting an extension cable to the connection cable, make the total cable length 10 m (32.8 ft.) or less.

Extension cables

Model	Length [m (ft.)]	
CCM010Z2ADFT	1 (3.3)	
CCM030Z2ADFT	3 (9.8)	
CCM050Z2ADFT	5 (16.4)	

• Flexible extension cables

Model	Length [m (ft.)]
CCM010Z2ADRT	1 (3.3)
CCM030Z2ADRT	3 (9.8)
CCM050Z2ADRT	5 (16.4)

7-2 Connection cables (For connector type)

■ Connection cables/Flexible connection cables

These cables are used when connecting a motor and a driver.

The model name of the connection cable varies depending on the outlet direction from the motor. Refer to the figures below.

memo

When installing the motor on a moving part, use a flexible cable.

Connection cables

Length [m (ft.)]	Cable outlet direction				
	Output shaft direction	Vertical direction	Opposite to output shaft direction		
0.2 (0.7)	CCM002Z1EFF	CCM002Z1EVF	CCM002Z1EBF		
0.5 (1.6)	CCM005Z1EFF	CCM005Z1EVF	CCM005Z1EBF		
1 (3.3)	CCM010Z1EFF	CCM010Z1EVF	CCM010Z1EBF		
2 (6.6)	CCM020Z1EFF	CCM020Z1EVF	CCM020Z1EBF		
3 (9.8)	CCM030Z1EFF	CCM030Z1EVF	CCM030Z1EBF		
5 (16.4)	CCM050Z1EFF	CCM050Z1EVF	CCM050Z1EBF		
7 (23.0)	CCM070Z1EFF	CCM070Z1EVF	CCM070Z1EBF		
10 (32.8)	CCM100Z1EFF	CCM100Z1EVF	CCM100Z1EBF		

Flexible connection cables

2 Guidance

If you are new to this product, read this chapter to understand the operating methods along with the operation flow. This is an example how to set the operation data and start the motor using a scanner.

Operating conditions

This operation is performed under the following conditions.

 \bullet Number of drivers connected: 1 unit

• IP address: 192.168.1.2

- Before operating the motor, check the condition of the surrounding area to ensure safety.
- Before starting based on the guidance, import the EDS file to the setting tool of the scanner and register the system configuration in advance. For details, contact your nearest Oriental Motor sales office.

STEP 1 Check the installation and the connection.

- *1 It is an Oriental motor cable. Purchase is required separately.
- *2 Connecting the control power supply allows you to continue monitoring even if the main power supply is shut off. Connect it as necessary.
- *3 It is recommended that a circuit breaker or a circuit protector is connected because incorrect wiring may cause the internal input circuit to short-circuit.

STEP 2 Make preparations for operation.

Refer to "Before starting operation" in the AZ Series OPERATING MANUAL Function Edition.

STEP 3 Set an IP address.

Set an IP address using the IP address setting switch (IP ADDR \times 1) on the driver.

1. Set the IP address setting switch as shown below.

Setting: 2 (192.168.1.2)

2. Turn on the main power supply and the control power supply again.

Be sure to turn off the main power supply and control power supply of the driver before setting the switch. Setting the switch while the main power supply and/or the control power supply are in an on-state will not enable the new setting.

STEP 4 The scanner starts the motor.

As an example, this section explains how to perform the following positioning operation.

Setting example

- Operation data number: 1
- Position: 5,000 steps
- Other settings: Initial values

Operation processing flow

Descriptions are given using the scanner as the subject.

1. Set the following operation data to turn the WR-REQ ON.

The operation data is set in the driver. When the setting is completed, the WR-END is turned ON.

Byte	Description	Setting value	Note
34, 35	Write parameter ID	3105	Parameter ID of "Position" of operation data No.1
36 to 39	Write data	5,000	Position: 5,000 steps

2. Turn the WR-REQ OFF.

The WR-END is returned to OFF.

- 3. Check the READY has been turned ON.
- 4. Select the operation data No.1 to turn the START ON. Positioning operation is started.
- 5. Check the READY has been turned OFF, and turn the START OFF.

STEP 5 Were you able to operate?

How did it go? Were you able to operate properly? If the motor does not operate, check the following points.

- Is the PWR/ALM LED blinking in red?
 An alarm is being generated. Refer to p.101 for details.
- Are the main power supply, control power supply, the motor, and the EtherNet/IP cable connected securely?
- Is the IP address set correctly?
- Is the NS LED lit in red or blinking in red?
 A communication error is being detected. Refer to p.100 for details.

3 Communication specifications

Con	nmunication standards	EtherNet/IP (conforms to CT18)
	Vendor ID	187: Oriental Motor Company
	Device type	43: Generic Device
	Transmission rate	10/100 Mbps (autonegotiation)
Co	ommunication mode	Full duplex/Half duplex (autonegotiation)
Cable specifications		Shielded twisted pair (STP) cable straight-through/crossover cable, category 5e or higher is recommended
Number of occupied	Output (scanner \rightarrow driver)	40 bytes
bytes	Input (driver \rightarrow scanner)	56 bytes
	Number of connections	2
	Connection type	Exclusive Owner, Input Only
Implicit	Communication cycle (RPI)	1 to 3,200 ms
communication	Connection type (scanner \rightarrow driver)	Point-to-Point
	Connection type (driver \rightarrow scanner)	Point-to-Point, Multicast
	Data trigger	Cyclic
IP a	ddress setting method	IP address setting switch, parameter, DHCP
	Network topology	Star, Linear bus, Ring (Device Level Ring)

Implicit message

Implicit message format

This section shows transfer contents of implicit message. The order of data is in little-endian format.

Byte	Input (driver → scanner)	Output (scanner \rightarrow driver)
0, 1	Remote I/O (R-OUT)	Remote I/O (R-IN)
2, 3	Operation data number selection_R	Operation data number selection
4, 5	Fixed I/O (OUT)	Fixed I/O (IN)
6, 7	Present alarm	Direct data operation operation type
8, 9	Feedback position (lower)	Direct data operation position (lower)
10, 11	Feedback position (upper)	Direct data operation position (upper)
12, 13	Feedback speed [Hz] (lower)	Direct data operation operating speed (lower)
14, 15	Feedback speed [Hz] (upper)	Direct data operation operating speed (upper)
16, 17	Command position (lower)	Direct data operation starting/changing rate (lower)
18, 19	Command position (upper)	Direct data operation starting/changing rate (upper)
20, 21	Torque monitor	Direct data operation stopping deceleration (lower)
22, 23	CST operating current	Direct data operation stopping deceleration (upper)
24, 25	Information (lower)	Direct data operation operating current
26, 27	Information (upper)	Direct data operation forwarding destination
28, 29	Reserved	Reserved
30, 31	Read parameter ID_R	Read parameter ID
32, 33	Read/write status	Write request
34, 35	Write parameter ID_R	Write parameter ID
36, 37	Read data (lower)	Write data (lower)
38, 39	Read data (upper)	Write data (upper)
40, 41	Assignable monitor 0 (lower)	-
42, 43	Assignable monitor 0 (upper)	-
44, 45	Assignable monitor 1 (lower)	-
46, 47	Assignable monitor 1 (upper)	_
48, 49	Assignable monitor 2 (lower) –	
50, 51	Assignable monitor 2 (upper) –	
52, 53	Assignable monitor 3 (lower)	-
54, 55	Assignable monitor 3 (upper)	_

Note For Implicit message, all data in the message format is periodically exchanged between the driver and the scanner. Therefore, check all data when setting it. If only some data is set, the data that is not set will be undefined, which may cause the driver to malfunction.

4-2 Input data

Data transferred from a driver to a scanner is called Input data.

■ Input data format

Contents of the Input data are as follows. The order of data is in little-endian format.

Assembly Instance	Attribute	Byte	Size (byte)	Description
		0, 1	2	Remote I/O (R-OUT)
		2, 3	2	Operation data number selection_R
		4, 5	2	Fixed I/O (OUT)
		6, 7	2	Present alarm
		8 to 11	4	Feedback position
		12 to 15	4	Feedback speed
		16 to 19	4	Command position
		20, 21	2	Torque monitor
	3	22, 23	2	CST operating current
100		24 to 27	4	Information
		28, 29	2	Reserved
		30, 31	2	Read parameter ID_R
		32, 33	2	Read/write status
		34, 35	2	Write parameter ID_R
		36 to 39	4	Read data
		40 to 43	4	Assignable monitor 0
		44 to 47	4	Assignable monitor 1
		48 to 51	4	Assignable monitor 2
		52 to 55	4	Assignable monitor 3

■ Details of Input data

Remote I/O (R-OUT)

This is the I/O accessed via EtherNet/IP.

The assignments of signals can be changed using the "R-OUT output function" parameters.

Bit	Name	Description	Initial assignment	
0	R-OUT0		64: M0_R	
1	R-OUT1		65: M1_R	65: M1_R
2	R-OUT2		66: M2_R	
3	R-OUT3		32: START_R	
4	R-OUT4		144: HOME-END	
5	R-OUT5		132: READY	
6	R-OUT6		135: INFO	
7	R-OUT7	Output in response to a signal assigned with	129: ALM-A	
8	R-OUT8	the "R-OUT output function" parameter.	136: SYS-BSY	
9	R-OUT9		160: AREA0	
10	R-OUT10		161: AREA1	
11	R-OUT11		162: AREA2	
12	R-OUT12		157: TIM	
13	R-OUT13		134: MOVE	
14	R-OUT14		138: IN-POS	
15	R-OUT15		140: TLC	

• Operation data number selection_R

Bit	Name	Description
0	M0_R	
1	M1_R	
2	M2_R	
3	M3_R	Output in response to an input signal
4	M4_R	Output in response to an input signal.
5	M5_R	
6	M6_R	
7	M7_R	
8 to 15	Reserved	0 is returned.

• Fixed I/O (OUT)

This is the I/O accessed via EtherNet/IP. Assignments of signals cannot be changed.

Bit	Name	Description
0	SEQ-BSY	Output while stored data operation is performed.
1	MOVE	Output while the motor operates.
2	IN-POS	Output when positioning operation is completed.
3	START_R	Output in response to an input signal.
4	HOME-END	Output when high-speed return-to-home operation or return-to-home operation is completed, or position preset is executed.
5	READY	Output when the driver is ready to operate.
6	DCMD-RDY	Output when the driver is ready to start direct data operation.
7	ALM-A	Output the alarm status of the driver. (Normally open)
8	TRIG_R	Output in response to an input signal.
9	TRIG-MODE_R	Output in response to an input signal.
10	SET-ERR	Output when an error occurs in any of the settings of the operation type, position, operating speed, starting/changing speed rate, stopping deceleration, operating current, or forwarding destination for direct data operation.
11	EXE-ERR	Output when direct data operation is failed to execute.
12	DCMD-FULL	Output when data is being written to the buffer area of direct data operation.
13	STOP_R	Output in response to an input signal.
14	Reserved	0 is returned.
15	TLC	Output when the output torque reaches the upper limit value.

Present alarm

Bit	Name	Description
0 to 15	Present alarm	This indicates the alarm code presently being generated.

Feedback position

Bit	Name	Description
0 to 31	Feedback position	This indicates the present feedback position. (step) When the wrap function is enabled, the value on the wrap coordinates is indicated.

• Feedback speed

Bit	Name	Description
0 to 31	Feedback speed	This indicates the present feedback speed. (Hz)

Command position

Bit	Name	Description
0 to 31	Command position	This indicates the present command position. (step) When the wrap function is enabled, the value on the wrap coordinates is indicated.

Torque monitor

Bit	Name	Description
0 to 15	Torque monitor	This indicates the torque presently generated as a percentage of the maximum holding torque. (1=0.1 %)

• CST operating current

Bit	Name	Description
0 to 15	CST operating current	This indicates the operating current of the α control (CST) mode. (1=0.1 %)

Information

Bit	Name	Description
0 to 31	Information	This indicates the information code presently being generated.

• Read parameter ID_R

Bit	Name	Description
0 to 15	Read parameter ID_R	This indicates a response of the read parameter ID.

Read/write status

Bit	Name	Description
0 to 6	Reserved	0 is returned.
7	RD-ERR	Output when an error occurred in reading. If reading is performed properly, the RD-REQ is turned OFF
8	WR-END	Output in response to the WR-REQ. The WR-END is also turned ON while the WR-REQ is ON. OFF: Write request waiting ON: Write completed
9	SYS-BSY	Output when the driver is in an internal processing state.
10	Reserved	0 is returned.
11	WR-SET-ERR	Output when the write parameter ID or write data is out of the setting range.
12	WR-IF-ERR	Output when writing cannot be performed due to user I/F communication in progress.
13	WR-NV-ERR	Output when writing cannot be performed due to non-volatile memory processing in progress.
14	WR-EXE-ERR	Output when a command cannot be executed.
15	WR-ERR	Output when an error occurred in writing. If the WR-REQ is turned OFF or writing is performed properly, the WR-ERR is also turned OFF.

Write parameter ID_R

Bit	Name	Description
0 to 15	Write parameter ID_R	This indicates a response of the write parameter ID .

• Read data

Bit	Name	Description
0 to 31	Read data	This indicates the value of the parameter shown in the parameter ID_R.

Assignable monitor

Bit	Name	Description
0 to 31	Assignable monitor n *	This indicates the value of the parameter set in the "Assignable monitor address n" parameter.

^{*} n: 0 to 3

4-3 Output data

Data transferred from a scanner to a driver is called Output data.

■ Output data format

Contents of the Output data are as follows. The order of data is in little-endian format.

Assembly Instance	Attribute	Byte	Size (byte)	Description
		0, 1	2	Remote I/O (R-IN)
		2, 3	2	Operation data number selection
		4, 5	2	Fixed I/O (IN)
		6, 7	2	Direct data operation operation type
		8 to 11	4	Direct data operation position
		12 to 15	4	Direct data operation operating speed
		16 to 19	4	Direct data operation starting/changing rate
101	3	20 to 23	4	Direct data operation stopping deceleration
		24, 25	2	Direct data operation operating current
		26, 27	2	Direct data operation forwarding destination
		28, 29	2	Reserved
		30, 31	2	Read parameter ID
		32, 33	2	Write request
		34, 35	2	Write parameter ID
		36 to 39	4	Write data

■ Details of Output data

• Remote I/O (R-IN)

This is the I/O accessed via EtherNet/IP. The assignments of signals can be changed using the "R-IN input function" parameters.

Bit	Name	Description	Initial assignment
0	R-IN0		
1	R-IN1		
2	R-IN2		
3	R-IN3		
4	R-IN4		
5	R-IN5		0: Not used
6	R-IN6		
7	R-IN7	These are used to execute the signal assigned	
8	R-IN8	with the "R-IN input function" parameter.	
9	R-IN9		
10	R-IN10		
11	R-IN11		
12	R-IN12		
13	R-IN13		
14	R-IN14		
15	R-IN15		

• Operation data number selection

Bit	Name	Description	Initial value
0	MO		
1	M1		
2	M2		
3	M3	The operation data number is selected using these eight bits.	0
4	M4		
5	M5		
6	M6		
7	M7		
8 to 15	Reserved	A value is disregarded.	0

• Fixed I/O (IN)

This is the I/O accessed via EtherNet/IP. Assignments of signals cannot be changed.

Bit	Name	Description	Initial value
0	FW-JOG	This is used to execute JOG operation in the forward direction.	
1	RV-JOG	This is used to execute JOG operation in the reverse direction.	
2	Reserved	A value is disregarded.	
3	START	This is used to execute stored data operation.	
4	ZHOME	This is used to execute high-speed return-to-home operation.	
5	STOP	This is used to stop the motor.	
6	FREE	This is used to shut off the motor current to put the motor into a non-excitation state. When an electromagnetic brake motor is used, the electromagnetic brake is in a state of releasing the motor shaft.	
7	ALM-RST	This is used to reset the alarm generated presently.	0
8	TRIG	This is used to execute direct data operation.	
9	TRIG-MODE	This is used to set the judgment level for the TRIG. 0: Start at ON edge 1: Start at ON level	
10	Reserved	A value is disregarded.	
11	Reserved	A value is disregarded.	
12	FW-JOG-P	This is used to execute inching operation in the forward direction.	
13	RV-JOG-P	This is used to execute inching operation in the reverse direction.	
14	FW-POS	This is used to execute continuous operation in the forward direction.	
15	RV-POS	This is used to execute continuous operation in the reverse direction.	

• Direct data operation operation type

Bit	Name	Description	Initial value
0 to 15	Direct data operation operation type	This is used to set the operation type for direct data operation. [Setting range] 0: No setting 1: Absolute positioning 2: Incremental positioning (based on command position) 3: Incremental positioning (based on feedback position) 7: Continuous operation (Position control) 8: Wrap absolute positioning 9: Wrap proximity positioning 10: Wrap forward direction absolute positioning 11: Wrap reverse direction absolute positioning 12: Wrap absolute push-motion 13: Wrap proximity push-motion 14: Wrap forward direction push-motion 15: Wrap reverse direction push-motion 16: Continuous operation (Speed control) 17: Continuous operation (Torque control) 20: Absolute positioning push-motion 21: Incremental positioning push-motion (based on command position) 22: Incremental positioning push-motion (based on feedback position)	2

• Direct data operation position

Bit	Name	Description	Initial value
	Direct data operation	This is used to set the target position for direct data operation.	
0 to 31	position	[Setting range] -2,147,483,648 to 2,147,483,647 steps	0

• Direct data operation operating speed

Bit	Name	Description	Initial value
0 to 31	Direct data operation operating speed	This is used to set the operating speed for direct data operation. [Setting range] -4,000,000 to 4,000,000 Hz	1,000

• Direct data operation starting/changing rate

Bit	Name	Description	Initial value
0 to 31	Direct data operation starting/changing rate	This is used to set the starting/changing rate or the starting/changing time for direct data operation. [Setting range] 1 to 1,000,000,000 (1=0.001 kHz/s, 1=0.001 s, or 1=0.001 ms/kHz)	1,000,000

• Direct data operation stopping deceleration

Bit	Name	Description	Initial value
0 to 31	Direct data operation stopping deceleration	This is used to set the stopping deceleration rate or the stop time for direct data operation. [Setting range] 1 to 1,000,000,000 (1=0.001 kHz/s, 1=0.001 s, or 1=0.001 ms/kHz)	1,000,000

• Direct data operation operating current

Bit	Name	Description	Initial value
0 to 15	Direct data operation operating current	This is used to set the operating current for direct data operation. [Setting range] 0 to 1,000 (1=0.1 %)	1,000

Direct data operation forwarding destination

Bit	Name	Description	Initial value
0 to 15	Direct data operation forwarding destination	This is used to select the stored area when the next direct data is transferred during direct data operation. [Setting range] 0: Execution memory 1: Buffer memory	0

Read parameter ID

	Bit Name		Description	Initial value
0 to 15 Read parameter ID		Read parameter ID	This is used to set the parameter ID to be read from.	0

Write request

	Bit	Name	Description	Initial value
	0	WR-REQ	This is used to set the write request. [Setting range] 0: Disable 1: Write request (ON edge)	0
_	1 to 15	Reserved	A value is disregarded.	0

Write parameter ID

Bit Name		Description	Initial value
0 to 15 Write parameter ID		This is used to set the parameter ID to be written to.	0

Write data

Bit	Name	ame Description	
0 to 31 Write data		This is used to set a value to be written to the parameter specified by the write parameter ID.	0

4-4 Processing order of Implicit communication

The processing order of Implicit communication is shown below.

- If multiple operation commands are set in the Implicit message format, the operation command of direct data operation is prioritized.
- If the operation commands for remote I/O (R-IN) and fixed I/O (IN) are set at the same time, operation will be as follows.
 - If the same operation command is set: The motor will start.
 - If different operation commands are set: The motor will not start, and information of Start operation error will be generated.

4-5 Data writing

This section explains the flow that data is written from the scanner to the driver via Implicit communication.

■ Area of Implicit message format used

Input (transfer from driver to scanner)

Byte	Description	
32, 33	Read/write status	
34, 35	Write parameter ID_R	

Output (transfer from scanner to driver)

Byte	Description	
32, 33	Write request	
34, 35	Write parameter ID	
36 to 39	Write data	

■ Flow that data is written to

^{*} If an error occurs while data is being written, the WR-END and WR-ERR are simultaneously turned ON.

4-6 Data reading

This section explains the flow that data is read from the driver to the scanner via Implicit communication. There are the following two methods to read data.

- Use an area of "Read data"
- Use an area of "Assignable monitor"

■ When an area of read data is used

Area of Implicit message format used

Input (transfer from driver to scanner)

Byte	Description	
30, 31	Read parameter ID_R	
32, 33	Read/write status	
36 to 39	Read data	

Output (transfer from scanner to driver)

Byte	Description
30, 31	Read parameter ID

Flow that data is read from

^{*} If the parameter ID out of setting range is set to the read parameter ID, the RD-ERR is turned ON at the same time when the read parameter ID_R is updated.

■ When an area of assignable monitor is used

 Area of Implicit message format used Input (transfer from driver to scanner)

Byte	Description
40 to 55	Assignable monitor 0 to assignable monitor 3

• Flow that data is read from

^{*} n: 0 to 3

Related parameters

Param	eter ID	Name	Description	Initial value
Dec	Hex	Name	Description	iiiitiai value
25600	6400h	Assignable monitor address 0	Sets the parameter ID to show on the assignable monitor. [Setting range] Set from items of "3 Monitor commands" on p.70	124: Driver temperature
25601	6401h	Assignable monitor address 1		125: Motor temperature
25602	6402h	Assignable monitor address 2		109: Cumulative load monitor
25603	6403h	Assignable monitor address 3		127: Tripmeter

5 Example of execution for operation

This chapter describes operations that operation data is set using the write data area. The method to execute operation is common to fixed I/O and remote I/O.

5-1 Positioning operation

As an example, this section explains how to perform the following positioning operation.

Setting example

- Operation data number: 1
- Position: 5,000 steps
- Other settings: Initial values

Operation processing flow

Descriptions are given using the scanner as the subject.

- 1. Set the following operation data to turn the WR-REQ ON.

 The operation data is set in the driver. When the setting is completed, the WR-END is turned ON.
 - Output (scanner → driver)

Byte	Description	Setting value	Note
34, 35	Write parameter ID	3105	Parameter ID of "Position" of operation data No.1
36 to 39	Write data	5,000	Position: 5,000 steps

Input (driver → scanner)

Byte	Description	Response	Note
34, 35	Write parameter ID_R	3105	Parameter ID of "Position" of operation data No.1

- 2. Turn the WR-REQ OFF.
 - The WR-END is returned to OFF.
- 3. Check the READY has been turned ON.
- 4. Select the operation data No.1 to turn the START ON. Positioning operation is started.
- 5. Check the READY has been turned OFF, and turn the START OFF.

5-2 Continuous operation

As an example, this section explains how to perform the following continuous operation.

Setting example

- Operation data number: 0
- Rotation direction: Forward direction
- Other settings: Initial values

Operation processing flow

Descriptions are given using the scanner as the subject.

- 1. Check the READY has been turned ON.
- 2. Set the following operation data to turn the FW-POS ON. Continuous operation is started.
 - Output (scanner → driver)

Byte	Description	Setting value	Note
2, 3	Operation data number selection	0	The operation data No.0 is selected.

3. To stop continuous operation, turn the FW-POS OFF. The motor decelerates to a stop.

6 Direct data operation

6-1 Overview of direct data operation

Direct data operation is a mode that allows start of operation at the same time as rewriting of data.

It is suitable to frequently change operation data such as the position (travel amount) or the operating speed, or to applications to adjust the position finely.

There are the following seven types of triggers to start operation at the same time as rewriting of data.

- One of the following items: Operation type, position, operating speed, starting/changing speed rate, stopping deceleration, and operating current
- The above six items are collectively rewritten

Direct data operation is executed with the TRIG of fixed I/O (IN).

A condition to execute direct data operation can be selected from the following two types using the TRIG-MODE of fixed I/O (IN).

- Start at ON edge of TRIG: The motor will start according to the operation data being set when the TRIG is turned ON.
- Start at ON level of TRIG: The motor will start at the same time when the data of the trigger set in the "Direct data operation trigger setting" parameter is changed.

■ Application example 1 of direct data operation

The position (travel amount) or the operating speed should be adjusted each time a load is changed because the feed rate is different in each load.

Setting example

- Position (travel amount): Change as desired
- Operating speed: Change as desired
- TRIG-MODE: Start at ON edge of TRIG

Operation processing flow

Descriptions are given using the scanner as the subject.

- 1. Write the position and the operating speed.
- 2. Turn the TRIG ON.

Result

When the TRIG is turned ON, the changed value is updated immediately, and operation is performed with the new position and operating speed.

■ Application example 2 of direct data operation

The operating speed should be changed immediately with the touch screen because a large load is inspected at a lower speed.

Setting example

- Operating speed: Change as desired
- Trigger: Operating speed (setting value of trigger: -4)
- TRIG-MODE: Start at ON level of TRIG

Operation processing flow

Descriptions are given using the scanner as the subject.

- 1. Write "-4" to the "Direct data operation trigger setting" parameter.
- 2. Write the data of the operating speed.
- 3. Turn the TRIG ON.
- 4. Change the operating speed.

Result

When the TRIG is turned ON, operation is started. If the operating speed is changed, the changed value is updated immediately, and the operation is performed at the new operating speed.

6-2 Output data and parameters required for direct data operation

Related Output data

Byte	Name	Description	Initial value
6, 7	Direct data operation operation type	This is used to set the operation type for direct data operation. [Setting range] 0: No setting 1: Absolute positioning 2: Incremental positioning (based on command position) 3: Incremental positioning (based on feedback position) 7: Continuous operation (Position control) 8: Wrap absolute positioning 9: Wrap proximity positioning 10: Wrap forward direction absolute positioning 11: Wrap reverse direction absolute positioning 12: Wrap absolute push-motion 13: Wrap proximity push-motion 14: Wrap forward direction push-motion 15: Wrap reverse direction push-motion 16: Continuous operation (Speed control) 17: Continuous operation (Torque control) 20: Absolute positioning push-motion 21: Incremental positioning push-motion (based on command position) 22: Incremental positioning push-motion (based on feedback position)	2
8 to 11	Direct data operation position	This is used to set the target position for direct data operation. [Setting range] -2,147,483,648 to 2,147,483,647 steps	0
12 to 15	Direct data operation operating speed	This is used to set the operating speed for direct data operation. [Setting range] -4,000,000 to 4,000,000 Hz	1,000

Byte	Name	Description	Initial value
16 to 19	Direct data operation starting/changing rate	This is used to set the acceleration/deceleration rate or the acceleration/deceleration time for direct data operation. [Setting range] 1 to 1,000,000,000 (1=0.001 kHz/s, 1=0.001 s, or 1=0.001 ms/kHz)	1,000,000
20 to 23	Direct data operation stopping deceleration	This is used to set the stopping deceleration rate or the stop time for direct data operation. [Setting range] 1 to 1,000,000,000 (1=0.001 kHz/s, 1=0.001 s, or 1=0.001 ms/kHz)	1,000,000
24, 25	Direct data operation operating current	This is used to set the operating current for direct data operation. [Setting range] 0 to 1,000 (1=0.1 %)	1,000
26, 27	Direct data operation forwarding destination	This is used to select the stored area when the next direct data is transferred during direct data operation. [Setting range] 0: Execution memory 1: Buffer memory	0

Related parameter

Parameter ID		Name Description		Initial value
Dec	Hex	Ivairie	Description	iiiiiai value
24852	6114h	Direct data operation trigger setting	Sets the trigger to execute direct data operation. The trigger setting is enabled only when the TRIG-MODE is set to "1: Start at ON level." [Setting range] -6: Operation type -5: Position -4: Operating speed -3: Starting/changing speed rate -2: Stopping deceleration -1: Operating current	1
			0: Disable 1: All data updated	

■ Trigger setting

This is a trigger to start operation at the same time as rewriting of data in direct data operation. The trigger setting is enabled only when the TRIG-MODE is set to "1: Start at ON level."

• When the trigger setting is "0"

Direct data operation is disabled.

• When the trigger setting is "1"

When the TRIG is turned from OFF to ON, direct data operation is started. After that, if any of data is changed, the motor will be started. The motor will be started only when data is changed.

● When the trigger setting is "-1 to -6"

When the TRIG is turned from OFF to ON, direct data operation is started. After that, only when the data corresponding to the trigger is changed, the motor will be started. Even if data other than the trigger is changed, the motor will not be started.

■ Data forwarding destination

During direct data operation, the stored area when the next direct data is transferred can be selected.

• When the forwarding destination is set to "0: Execution memory"

If the TRIG is turned from OFF to ON or the data corresponding to the trigger is changed, the data during operation can be rewritten to the next direct data.

When the forwarding destination is set to "1: Buffer memory"

If the TRIG is turned from OFF to ON or the data corresponding to the trigger is changed, the next direct data is saved in the buffer memory. When the data during operation is completed, operation of the buffer memory is automatically started. One direct data can be stored in the buffer memory.

If the next direct data is written to the buffer memory, the DCMD-FULL output is turned ON.

During stop or continuous operation, if "Buffer memory" is specified, the data is not stored in the buffer memory and it is rewritten to the next direct data immediately.

memo)

The direct data cannot be written to the buffer memory while the DCMD-FULL output is being ON.

6-3 Operation example

A condition to execute direct data operation can be selected from the ON edge or ON level of TRIG of fixed I/O (IN). A condition can be selected with the TRIG-MODE of fixed I/O (IN).

Before operating the motor, check the condition of the surrounding area to ensure safety.

■ When direct data operation is executed at ON edge of TRIG

As an example, this section explains how to perform the following direct data operation.

Setting example

- Operation type: Incremental positioning (based on command position)
- Position: 5,000 steps
- Operating speed: 1,000 Hz
- Starting/changing speed rate: 1,000 kHz/s
- Stopping deceleration: 1,000 kHz/s
- Operating current: 100 %
- Forwarding destination: Execution memory

Operation processing flow

Descriptions are given using the scanner as the subject.

- 1. Check the DCMD-RDY has been turned ON.
- 2. Set the following data.
 - Output (scanner → driver)

Byte	Description	Setting value	Note
4, 5	TRIG-MODE [bit 9 of fixed I/O (IN)]	0	Start at ON edge
6, 7	Direct data operation operation type	2	Incremental positioning (based on command position)
8 to 11	Direct data operation position	5,000	5,000 steps
12 to 15	Direct data operation operating speed	1,000	1,000 Hz
16 to 19	Direct data operation starting/changing rate	1,000,000	1,000 kHz/s
20 to 23	Direct data operation stopping deceleration	1,000,000	1,000 kHz/s
24, 25	Direct data operation operating current	1,000	100.0 %
26, 27	Direct data operation forwarding destination	0	Execution memory

3. Turn the TRIG ON.

Direct data operation is started.

4. Check the TRIG_R has been turned ON, and turn the TRIG OFF.

■ When direct data operation is executed at ON level of TRIG

This section explains how to execute the following direct data operation with setting the trigger to "position." Set the trigger with the "Direct data operation trigger setting" parameter.

Setting example

• Operation 1

Position: 7,000 steps

• Operation 2

Position: 3,000 steps

• Other settings

Description	Setting value
Operation type	Incremental positioning (based on command position)
Operating speed	1,000 Hz
Starting/changing rate	1,000 kHz/s

Setting value
1,000 kHz/s
100 %
Execution memory

Operation processing flow

Descriptions are given using the scanner as the subject.

- 1. Set the following parameters to turn the WR-REQ ON.

 The parameter information is set to the driver. When the setting is completed, the WR-END is turned ON.
 - Output (scanner → driver)

Byte	Description	Setting value	Note
34, 35	Write parameter ID	24852	Parameter ID of "Direct data operation trigger setting"
36 to 39	Write data	-5	Position

2. Turn the WR-REQ OFF.

The WR-END is returned to OFF.

- 3. Check the DCMD-RDY has been turned ON.
- 4. Set the following data.
 - Output (scanner → driver)

Byte	Description	Setting value	Note
4, 5	TRIG-MODE [bit 9 of fixed I/O (IN)]	1	Start at ON level
6, 7	Direct data operation operation type	2	Incremental positioning (based on command position)
8 to 11	Direct data operation position	7,000	7,000 steps
12 to 15	Direct data operation operating speed	1,000	1,000 Hz
16 to 19	Direct data operation starting/changing rate	1,000,000	1,000 kHz/s
20 to 23	Direct data operation stopping deceleration	1,000,000	1,000 kHz/s
24, 25	Direct data operation operating current	1,000	100 %
26, 27	Direct data operation forwarding destination	0	Execution memory

5. Turn the TRIG ON.

Direct data operation of the operation 1 is started.

- 6. Check the operation 1 is completed, and set the following data. Direct data operation of the operation 2 is started.
 - Output (scanner → driver)

Byte	Byte Description		Note	
8 to 11	Direct data operation position	3,000	3,000 steps	

- To execute direct data operation of the operation 2, set a different value from the operation 1 in the "position" of the operation 2.
- If a value other than the "position" is changed, direct data operation of the operation 2 will not be executed.

4 Parameter ID lists

This part describes the parameter ID lists to be set via EtherNet/IP.

Data and parameters described here can also be set using the MEXEO2 software.

1 Timing for parameter to update

All data used with the driver is 32 bits wide.

Parameters are saved in the RAM or non-volatile memory of the driver. Parameters stored in the RAM are erased once the main power supply and control power supply are shut off, however, those stored in non-volatile memory are retained even if these power supplies are shut off.

When the control power supply of the driver is turned on, the parameters stored in the non-volatile memory are transfered to the RAM, and recalculation and setup for the parameters are executed in the RAM.

Parameters having set via Implicit communication are saved in the RAM. To save the parameters stored in the RAM to the non-volatile memory, execute the "Write batch NV memory" of the maintenance command.

When a parameter is changed, the timing to update the new value varies depending on the parameter. Refer to "Notation rules" for details about the update timing.

Do not shut off the main power supply and the control power supply while writing the data to the non-volatile memory, and also do not shut off for five seconds after the completion of writing the data. Doing so may abort the data write and cause an alarm of EEPROM error (alarm code 41h) to generate.

- Parameters set via Implicit communication are saved in the RAM. For parameters that requires to turn on the main power supply and the control power supply again for updating, be sure to save them in the non-volatile memory before turning off the power supplies.
- The non-volatile memory can be rewritten approximately 100,000 times.

■ Notation rules

Timing to update

In this part, each update timing is represented in an alphabet.

Notation	Update timing	Description
А	Immediately	Recalculation and setup are immediately executed when the parameter is written.
В	After operation stop	Recalculation and setup are executed when the operation is stopped.
С	After executing Configuration	Recalculation and setup are executed after Configuration is executed or the main power supply and control power supply are turned on again.
D	After turning on the main power supply and control power supply again	Recalculation and setup are executed after the main power supply and control power supply are turned on again.

READ and WRITE

READ/WRITE may be represented as follows in this manual.

Notation	Description
R	READ
W	WRITE
R/W	READ/WRITE

2 Maintenance commands

Maintenance commands are used to execute the alarm reset, clear latch information, batch processing of the non-volatile memory and others.

Refer to the **AZ** Series <u>OPERATING MANUAL Function Edition</u> for details about parameters. When checking the **AZ** Series <u>OPERATING MANUAL Function Edition</u>, use the parameter name instead of the parameter ID.

The maintenance commands include processing in which the memory is operated, such as batch processing of the non-volatile memory and P-PRESET. Exercise caution not to execute them unnecessarily in succession.

Parameter ID		Name	Cotting round	Initial value
Dec	Hex	name	Setting range	initiai vaiue
192	00C0h	Alarm reset		
194	00C2h	Clear alarm history		
197	00C5h	P-PRESET execution		
198	00C6h	Configuration		
199	00C7h	Batch data initialization (excluding communication parameters)		
200	00C8h	Read batch NV memory		
201	00C9h	Write batch NV memory		
202	00CAh	All data batch initialization (including communication parameters)	_	_
203	00CBh	Read from backup		
204	00CCh	Write to backup		
205	00CDh	Clear latch information		
206	00CEh	Clear sequence history		
207	00CFh	Clear tripmeter		
209	00D1h	ZSG-PRESET		
210	00D2h	Clear ZSG-PRESET		
211	00D3h	Clear information		
212	00D4h	Clear information history		
213	00D5h	Alarm history details	1 to 10: Alarm history 1 to 10	0: Not selected

■ Configuration

Configuration can be executed when all of the following conditions are satisfied.

- An alarm is not being generated.
- The motor is not operating.
- I/O test, teaching, remote operation, teaching, and downloading are not executed with the MEXEO2.

The table below shows the driver status before and after Configuration is executed.

Item	Configuration is ready to execute	Configuration is being executed	After configuration is executed
PWR/ALM LED	Green light	Blinking blue	
Electromagnetic brake	Hold/release	Hold	Based on the driver condition.
Motor excitation	Excitation/non-excitation	Non-excitation	
Output signal	Enable	Disable	Enable
Input signal	Enable	Disable	Enable

The correct monitor value may not be returned even if monitoring is executed during configuration.

3 Monitor commands

Monitor commands are used to monitor the command position, command speed, alarm and information history and others. All commands are used for read (READ).

Refer to the **AZ** Series <u>OPERATING MANUAL Function Edition</u> for details about parameters. When checking the **AZ** Series <u>OPERATING MANUAL Function Edition</u>, use the parameter name instead of the parameter ID.

Parameter ID		
Dec	Hex	Name

4-2 Parameter ID

The setting item of operation data is set with the operation data R/W command.

The parameter ID for the setting item is arranged based on the base address of the operation data number. (Base address \Rightarrow p.76)

For example, in the case of the setting item "Position," 1 is added to the base address.

Parameter ID	Name	Setting range	Initial value	Update
Base address +0	Operation type	1: Absolute positioning 2: Incremental positioning (based on command position) 3: Incremental positioning (based on feedback position) 7: Continuous operation (position control) 8: Wrap absolute positioning 9: Wrap proximity positioning 10: Wrap absolute positioning (FWD) 11: Wrap absolute positioning (RVS) 12: Wrap absolute positioning (RVS) 12: Wrap absolute push-motion 13: Wrap proximity push-motion 14: Wrap push-motion (FWD) 15: Wrap push-motion (FWD) 15: Continuous operation (Speed control) 17: Continuous operation (Torque control) 20: Absolute positioning push-motion (based on command position) 22: Incremental positioning push-motion (based on feedback position)	2	В
Base address +1	Position	-2,147,483,648 to 2,147,483,647 steps	0	В
Base address +2	Operating speed	-4,000,000 to 4,000,000 Hz	1,000	В
Base address +3	Starting/changing rate	1 to 1,000,000,000 (1=0.001 kHz/s, 1=0.001 s, or 1=0.001 ms/kHz)	1,000,000	В
Base address +4	Stop	1 to 1,000,000,000 (1=0.001 kHz/s, 1=0.001 s, or 1=0.001 ms/kHz)	1,000,000	В
Base address +5	Operating current	0 to 1,000 (1=0.1 %)	1,000	В
Base address +6	Drive-complete delay time	0 to 65,535 (1=0.001 s)	0	В
Base address +7	Link	0: No link 1: Manual sequential 2: Automatic sequential 3: Continuous sequential operation	0	В
Base address +8	Next data number	-256: Stop -2 : $\downarrow \downarrow$ (+2) -1 : \downarrow (+1) 0 to 255: Operation data number	-1	В
Base address +9	Area offset	-2,147,483,648 to 2,147,483,647 steps	0	В
Base address +10	Area width	−1: Disable 0 to 4,194,303: Set by 1 step	-1	В
Base address +11	Loop count	0: None (–) 2 to 255: Number of loops (loop 2 { to loop 255 {)	0	В
Base address +12	Loop offset	-4,194,304 to 4,194,303 steps	0	В
Base address +13	Loop end point	0: None (–) 1: Loop end (} L-End)	0	В
Base address +14	(Low) I/O event number	-1: None (-) 0 to 31: Operation I/O event number (0 to 31)	-1	В

Parameter ID	Name	Setting range	Initial value	Update
Base address +15	(High) I/O event number	-1: None (-) 0 to 31: Operation I/O event number (0 to 31)	-1	В

4-3 Setting example

As an example, this section explains how to set the following operation data to the operation data No.0 to No.2.

Setting item	Operation data No.0	Operation data No.1	Operation data No.2
Operation type	Absolute positioning	Incremental positioning (based on command position)	Incremental positioning (based on feedback position)
Position [step]	1,000	1,000	1,000
Operating speed [Hz]	1,000	1,000	1,000
Operating current [%]	50.0	70.0	100.0

■ Setting of operation data No.0

Seeing the table on p.76, we can find that the base address of the operation data No.0 is "3072 (0C00h)." Based on this base address, the parameter ID for the setting item is calculated from the table on p.78.

Base address	
3072 (0C00h)	

Cotting itom		Setting		
Setting item	Calculation method	Dec	Hex	value
Operation type	Base address +0	3072 + 0 = 3072	0C00h	1
Position	Base address +1	3072 + 1 = 3073	0C01h	1,000
Operating speed	Base address +2	3072 + 2 = 3074	0C02h	1,000
Operating current	Base address +5	3072 + 5 = 3077	0C05h	500

■ Setting of operation data No.1

Seeing the table on p.76, we can find that the base address of the operation data No.1 is "3104 (OC20h)." Based on this base address, the parameter ID for the setting item is calculated from the table on p.78.

Base address
3104 (0C20h)

Cotting itom		Setting		
Setting item	Calculation method	Dec	Hex	value
Operation type	Base address +0	3104 + 0 = 3104	0C20h	2
Position	Base address +1	3104 + 1 = 3105	0C21h	1,000
Operating speed	Base address +2	3104 + 2 = 3106	0C22h	1,000
Operating current	Base address +5	3104 + 5 = 3109	0C25h	700

■ Setting of operation data No.2

Seeing the table on p.76, we can find that the base address of the operation data No.2 is "3136 (0C40h)." Based on this base address, the parameter ID for the setting item is calculated from the table on p.78.

Base address 3136 (0C40h)	
3136 (0C40h)	

Catting its m		Setting		
Setting item	Calculation method	Dec	Hex	value
Operation type	Base address +0	3136 + 0 = 3136	0C40h	3
Position	Base address +1	3136 + 1 = 3137	0C41h	1,000
Operating speed	Base address +2	3136 + 2 = 3138	0C42h	1,000
Operating current	Base address +5	3136 + 5 = 3141	0C45h	1,000

5 Operation I/O event R/W commands

If a specified event (ON/OFF of I/O) is generated during operation of the motor, another operation can be started. This is called operation I/O event. This chapter explains the address to execute the operation I/O event.

5-1 Base address of operation I/O event

Base a	ddress	Operation I/O
Dec	Hex	event number
2560	0A00h	0
2568	0A08h	1
2576	0A10h	2
2584	0A18h	3
2592	0A20h	4
2600	0A28h	5
2608	0A30h	6
2616	0A38h	7
2624	0A40h	8
2632	0A48h	9
2640	0A50h	10

Base a	ddress	Operation I/O
Dec	Hex	event number
2648	0A58h	11
2656	0A60h	12
2664	0A68h	13
2672	0A70h	14
2680	0A78h	15
2688	0A80h	16
2696	0A88h	17
2704	0A90h	18
2712	0A98h	19
2720	0AA0h	20
2728	0AA8h	21

Base a	ddress	Operation I/O
Dec	Hex	event number
2736	0AB0h	22
2744	0AB8h	23
2752	0AC0h	24
2760	0AC8h	25
2768	0AD0h	26
2776	0AD8h	27
2784	0AE0h	28
2792	0AE8h	29
2800	0AF0h	30
2808	0AF8h	31
	•	

5-2 Parameter ID for operation I/O event R/W command

The setting item of operation I/O event is set with the operation I/O event R/W command. The parameter ID for the setting item is arranged based on the base address of the operation I/O event. For example, in the case of the setting item "Dwell," 2 is added to the base address.

Parameter ID	Name	Setting range	Initial value	Update
Base address +0	Link	0: No link 1: Manual sequential 2: Automatic sequential 3: Continuous sequential operation	0	В
Base address +1	Next data number	-256: Stop -2: $\downarrow\downarrow$ (+2) -1: \downarrow (+1) 0 to 255: Operation data number	-256	В
Base address +2	Dwell	0 to 65,535 (1=0.001 s)	0	В
Base address +3	Event trigger I/O	Input signal list □ p.96 Output signal list□ p.97	0: No function	В
Base address +4	Event trigger type	0: Non 1: ON (calculated cumulative ms) 2: ON (ms) 3: OFF (calculated cumulative ms) 4: OFF (ms) 5: ON edge 6: OFF edge 7: ON (cumulative ms) 8: OFF (cumulative ms)	0	В
Base address +5	Event trigger counter	0 to 65,535 (1=1 ms or 1=once)	0	В

6 Protect release commands

The key codes for reading/writing of data from/to the backup area and the key codes for release of function limitation by the HMI input are set.

Refer to the **AZ** Series <u>OPERATING MANUAL Function Edition</u> for details about parameters. When checking the **AZ** Series <u>OPERATING MANUAL Function Edition</u>, use the parameter name instead of the parameter ID.

Parameter ID		Name	Cotting range	Initial
Dec	Hex	Name	Setting range	value
32	0020h	Backup DATA access key		
33	0021h	Backup DATA write key	Refer to the next table.	0
34	0022h	HMI release key		

Key code table

Process that requires protect release	Command name	Key code
Data uniting to backup area	Backup DATA access key	20519253 (01391955h)
Data writing to backup area	Backup DATA write key	1977326743 (75DB9C97h)
Data reading from backup area	Backup DATA access key	20519253 (01391955h)
Release of limitation by HMI input	HMI release key	864617234 (33890312h)

7 Extended operation data setting R/W command

Parameters for extended operation data setting can be set.

Refer to the **AZ** Series <u>OPERATING MANUAL Function Edition</u> for details about parameters. When checking the **AZ** Series <u>OPERATING MANUAL Function Edition</u>, use the parameter name instead of the parameter ID.

Param	eter ID Name		Setting range	Initial value	Update
Dec	Hex	Ivaille	Setting range	IIIIIIai value	Opuate
320	0140h	Common acceleration rate or time	1 to 1,000,000,000 (1=0.001 kHz/s, 1=0.001 s, or 1=0.001 ms/kHz)	1,000,000	А
321	0141h	Common stopping deceleration	1 to 1,000,000,000 (1=0.001 kHz/s, 1=0.001 s, or 1=0.001 ms/kHz)	1,000,000	А
326	0146h	Rate selection	0: The common rate is used 1: The rate of each operation data is used	1	А
2048	0800h	Repeat start operation data number	−1: Disable 0 to 255: Operation data number	-1	А
2049	0801h	Repeat end operation data number	−1: Disable 0 to 255: Operation data number	-1	А
2050	0802h	Repeat time	-1: Disable 0 to 100,000,000	-1	А

Rewrite the parameters of the extended operation data setting R/W command while operation is stopped.

8 Parameter R/W commands

These commands are used to write or read parameters.

Refer to the **AZ** Series <u>OPERATING MANUAL Function Edition</u> for details about parameters. When checking the **AZ** Series <u>OPERATING MANUAL Function Edition</u>, use the parameter name instead of the parameter ID.

8-1 Driver action simulation setting parameter

Param	eter ID	Name	Setting range	Initial	Update
Dec	Hex	Name	Setting range	value	
511	01FFh	Driver simulation mode	0: Use real motor 1: Virtual motor (when ABZO not connected = no ABZO information) 2: Virtual motor (when ABZO not connected = 1,800 rev wrap enable) 3: Virtual motor (when ABZO not connected = 900 rev wrap enable)	0	D

8-2 Base setting parameter

Parameter ID		Nove	Catting	Initial value	l lis data
Dec	Hex	- Name	Setting range	Initial value	Update
294	0126h	Base current	0 to 1,000 (1=0.1 %)	1,000	Α
296	0128h	Stop current	0 to 1,000 (1=0.1 %)	500	Α
297	0129h	Command filter setting	1: LPF (speed filter) 2: Moving average filter	1	В
298	012Ah	Command filter time constant	0 to 200 ms	1	В
300	012Ch	Smooth drive function	0: Disable 1: Enable	1	С
301	012Dh	Current control mode	0: Follow the CCM input 1: Alpha control mode (CST) 2: Servo emulation mode (SVE)	0	А
302	012Eh	Servo emulation (SVE) ratio	0 to 1,000 (1=0.1 %)	1,000	А
303	012Fh	SVE position loop gain	1 to 50	10	Α
304	0130h	SVE speed loop gain	10 to 200	180	Α
305	0131h	SVE speed loop integral time constant	100 to 2000 (1=0.1 ms)	1,000	Α
306	0132h	Automatic current cutback function	0: Disable 1: Enable	1	А
307	0133h	Automatic current cutback switching time	0 to 1,000 ms	100	А
308	0134h	Operating current ramp up rate	0 to 100 ms/100 %	0	А
309	0135h	Operating current ramp down rate	0 to 100 ms/100 %	0	А
311	0137h	Resonance suppression control frequency	100 to 2,000 Hz	1,000	А
312	0138h	Resonance suppression control gain	-500 to 500	0	Α
313	0139h	Deviation acceleration suppressing gain	0 to 500	45	А
506	01FAh	Main power mode *	-1: Automatic discrimination (discriminates the input power supply voltage automatically) 0: 24 VDC 1: 48 VDC	-1	D

* It is used to set the voltage mode of the main power supply. The voltage mode of the main power supply is discriminated in 50 ms after the main power supply is turned on. Set the "Main power mode" parameter to "0: 24 VDC" or "1: 48 VDC" when the main power supply starts up slowly or the voltage of the main power supply is unstable.

8-3 Coordinate parameters

Param	eter ID	Name	Cotting range	Initial value	Undata
Dec	Hex	Name	Setting range	mitiai vaiue	Update
451	01C3h	Software overtravel	-1: Disable0: Immediate stop1: Deceleration stop2: Immediate stop with alarm3: Deceleration stop with alarm	3	A
452	01C4h	Positive software limit	-2,147,483,648 to 2,147,483,647 steps	2,147,483,647	Α
453	01C5h	Negative software limit	-2,147,483,648 to 2,147,483,647 steps	-2,147,483,648	А
454	01C6h	Preset position	-2,147,483,648 to 2,147,483,647 steps	0	А

8-4 Operation parameters

460	01CCh	Initial coordinate generation & wrap range offset value	-536,870,912 to 536,870,911 steps	0	С
461	01CDh	The number of the RND-ZERO output in wrap range	1 to 536,870,911 divisions	1	С

• Value that can be set in the "Initial coordinate generation & wrap setting range" parameter

Since the internal coordinate of the ABZO sensor is 1,800 rev (or 900 rev), select a value from the table, and set in the "Initial coordinate generation & wrap setting range" parameter, In the table, the values which are surrounded with thick box border cannot be set for the ABZO sensor of 900 revolutions.

The table shows the values when setting with the **MEXEO2** software. When setting via Implicit communication, multiply the values in the table by 10.

	Wrap setting range [rev]									
0.5	1.8	4.8	12.0	25.0	72.0	200.0

363	016Bh	(HOME) Operating current for push- home-seeking	0 to 1,000 (1=0.1 %)	1,000	В
364	016Ch	(HOME) Backward steps after first entry in push-home-seeking	0 to 8,388,607 steps	0	В
365	016Dh	(HOME) Pushing time in push-home- seeking	1 to 65,535 ms	200	В
366	016Eh	(HOME) Backward steps in push-home- seeking	0 to 8,388,607 steps	500	В

^{*} Two input signals are provided for the mini Driver. Return-to-home operation of the 3-sensor mode requires three inputs: HOMES input, FW-LS input, and RV-LS input. Therefore, return-to-home operation of the 3-sensor mode is not recommended for the mini Driver.

1 Detection of communication errors

This chapter explains a function to detect that an error occurred in EtherNet/IP.

1-1 Communication timeout

If Implicit communication is interrupted due to disconnection of the EtherNet/IP cable or other reasons, the communication timeout is detected.

When the communication timeout is detected, the NS LED on the driver blinks in red.

When connection with the scanner is established again, the communication timeout is automatically cleared, and the NS LED on the driver returns to be lit in green.

If the communication timeout is detected, check the following points.

- Is the EtherNet/IP cable disconnected?
- Is the power supply for the scanner is turned on?

1-2 IP address conflict

If an IP address of the EtherNet/IP compatible products is duplicated in the same system, the IP address conflict is detected.

When the IP address conflict is detected, the NS LED on the driver is lit in red.

If the IP address conflict is detected, change the setting so that an IP address of the EtherNet/IP compatible products is not duplicated.

Check the IP address is not duplicated, and then turn on the control power supply again.

2 Alarms

This driver has the alarm function to protect from temperature rise, poor connection, error in operation, and the like. If an alarm is generated, the ALM-A output is turned ON and the ALM-B output is turned OFF to stop the motor. At the same time, the PWR/ALM LED blinks in red.

Details of the alarm being generated can be checked by counting the number of times the PWR/ALM LED blinks, or using EtherNet/IP or the **MEXEO2** software.

2-1 Alarm reset

Before resetting an alarm, always remove the cause of the alarm and ensure safety, and perform one of the reset operations specified below.

- Turn the ALM-RST input ON. (It is enabled at the ON edge of the input.)
- Execute the alarm reset with the maintenance command via EtherNet/IP.
- Execute the alarm reset using the **MEXEO2** software.
- Turn off the main power supply and the control power supply, and on again.

- Some alarms cannot be reset by other methods than turning on the main power supply and control power supply again. Refer to "2-4 Alarm list" on p.102.
- An alarm of the absolute position error can be reset if the position preset or return-to-home operation is performed. If it cannot be reset by these methods, the ABZO sensor may be damaged.

2-2 Alarm history

Up to 10 generated alarm items are stored in the non-volatile memory in order of the latest to the oldest. The alarm history stored in the non-volatile memory can be read or cleared if one of the following reset operations is performed.

- Read the alarm history by the monitor command via EtherNet/IP.
- Clear the alarm history by the maintenance command via EtherNet/IP.
- Read or clear the alarm history using the MEXEO2 software.

2-3 Generation condition of alarms

Alarms shown in the table will be generated if the generation condition is exceeded.

Alarm code	Alarm name	Motor model	Generation condition
21h	Main circuit overheat	-	85 °C (185 °F)
22h	Overvoltage	-	36 V *1 63 V *2
26h	Motor overheat	-	85 °C (185 °F)
31h		AZM14, AZM15, AZM24, AZM26	8,000 r/min
	Overspeed	AZM46, AZM48, AZM66	4,500 r/min
		AZM69	2,500 r/min
34h	Command pulse error	-	38,400 r/min

^{*1} When the Main power mode is 24 VDC.

^{*2} When the Main power mode is 48 VDC.

2-4 Alarm list

Alarm code	Number of times LED blinks	Alarm type	Cause	Remedial action	How to reset	Motor excitation *
10h	4	Excessive position deviation	When the motor was in a state of current ON, the deviation between the command position and the feedback position exceeded the value set in the "Excessive position deviation alarm" parameter in the motor shaft. A load is large, or the acceleration/deceleration time or the acceleration/ deceleration rate is too short against the load. The operating range of positioning push-motion SD operation was exceeded.	Decrease the load. Increase the acceleration/ deceleration time or slow the acceleration/deceleration rate. increase the operating current. Reconsider the operation data.	Any of reset operations	Non- excitation
20h	5	Overcurrent	The motor, the cable, and the driver output circuit were short-circuited.	Turn off the main power supply and the control power supply first, and check that the motor, the cable, and the driver are not damaged. After that, turn on the main power supply and the control power supply again. If the alarm is still not reset, the motor, the cable, or the driver may be damaged. Contact your nearest Oriental Motor sales office.	Turn on the main power supply and control power supply again	Non- excitation
21h	2	Main circuit overheat	The internal temperature of the driver reached the upper limit of the specification value.	Reconsider the ventilation condition.	Any of reset operations	Non- excitation
22h	3	Overvoltage	 The main power supply voltage exceeded the permissible value. A large load inertia was suddenly stopped. Vertical operation (elevating operation) was performed. 	 Check the input voltage of the main power supply. Decrease the load. Increase the acceleration/ deceleration time or slow the acceleration/deceleration rate. 	Any of reset operations	Non- excitation
23h	3	Main power supply OFF	The main power supply was shut off during operation.	Check if the main power supply is properly supplied.	Any of reset operations	Non- excitation
25h	3	Undervoltage	The main power supply was shut off momentarily or the voltage became low.	Check the input voltage of the main power supply.	Any of reset operations	Non- excitation
26h	8	Motor overheat	The detection temperature of the ABZO sensor reached the upper limit of the specification value.	 Check the heat radiation condition of the motor. Reconsider the ventilation condition. 	Any of reset operations	Non- excitation
28h	8	Sensor error	An error of the ABZO sensor was detected during operation.	Turn off the main power supply and the control power supply, and check the connection of the motor. After that, turn on the main power supply and the control power supply again.	Turn on the main power supply and control power supply again	Non- excitation

Alarm code	Number of times LED blinks	Alarm type	Cause	Remedial action	How to reset	Motor excitation *
29h	9	CPU peripheral circuit error	 A temperature significantly higher or lower than the specifications was detected. The driver internal circuit was damaged. 	Reconsider the ambient temperature and ventilation condition. Turn off the main power supply and the control power supply, and check if the driver is damaged. After that, turn on the main power supply and the control power supply again. If the alarm has still not reset, the driver may be damaged. Contact your nearest Oriental Motor sales office.	Turn on the main power supply and control power supply again	Non- excitation
2Ah	8	ABZO sensor communication error	An error was detected in communication between the driver and the ABZO sensor.	Turn off the main power supply and the control power supply, and check the connection of the ABZO sensor. After that, turn on the main power supply and control power supply again.	Turn on the main power supply and control power supply again	Non- excitation
30h	2	Overload	A load exceeding the maximum torque was applied for the time exceeded the value set in the "Overload alarm" parameter.	 Decrease the load. Increase the acceleration/ deceleration time or slow the acceleration/deceleration rate. Increase the operating current. 	Any of reset operations	Non- excitation
31h	2	Overspeed	The feedback speed of the motor output shaft exceeded the specification value.	 Reconsider the "Electronic gear A" parameter and the "Electronic gear B" parameter, and set the speed of the motor output shaft to a value lower than the specification value. If an overshoot is occurred at the time of accelerating, increase the acceleration time or slow the acceleration rate. 	Any of reset operations	Non- excitation
33h	7	Absolute position error	The home information of the ABZO sensor was damaged.	Perform the position preset or return-to-home operation to set the home again.	Turn on the main power supply and control power supply again	Non- excitation
34h	2	Command pulse error	The command pulse frequency exceeded the specification value.	Decrease the frequency of the command pulse.	Any of reset operations	Non- excitation
41h	9	EEPROM error	The data stored in the driver was damaged.	Initialize all parameters.	Turn on the main power supply and control power supply again	Non- excitation
42h	8	Sensor error at power-on	An error of the ABZO sensor was detected when the control power supply was turned on.	Turn off the main power supply and the control power supply, and check the connection of the ABZO sensor. After that, turn on the main power supply and control power supply again.	Turn on the main power supply and control power supply again	Non- excitation
43h	8	Rotation error at power on	The motor was being rotated when the control power supply was turned on.	Reconsider the load conditions so that the motor output shaft does not rotate by an external force when the control power supply is turned on.	Turn on the main power supply and control power supply again	Non- excitation

Alarm code	Number of times LED blinks	Alarm type	Cause	Remedial action	How to reset	Motor excitation *
44h	8	Encoder EEPROM error	The data stored in the ABZO sensor was damaged.	Execute either of the following operations. If the same alarm is still generated, the ABZO sensor has been damaged. Contact your nearest Oriental Motor sales office. • Set phase Z again with the "ZSG-PRESET" of the maintenance command. • Execute the "Clear tripmeter" of the maintenance command.	Turn on the main power supply and control power supply again	Non- excitation
45h	8	Motor combination error	A motor not allowed to combine with the driver was connected. (Refer to p.106 for details.)	Check the motor model and the driver model, and connect them in a correct combination.	Turn on the main power supply and control power supply again	Non- excitation
4Ah	7	Return-to-home incomplete	Absolute positioning operation was started in a state where the coordinates had not been set.	Execute the position preset or return-to-home operation.	Any of reset operations	Excitation
60h	7	±LS both sides active	When the "FW-LS/RV-LS input action" parameter is set to "2: Immediate stop with alarm" or "3: Deceleration stop with alarm," both the FW-LS input and the RV-LS input were detected. Return-to-home operation was executed in a state where both the FW-LS input and the RV-LS input were detected.	Check the sensor logic installed and the "Inverting mode" parameter.	Any of reset operations	Excitation
61h	7	Reverse ±LS connection	The LS input opposite to the operating direction was detected while return-to-home operation in the 2-sensor mode or the 3-sensor mode was performed.	Check the wiring of the sensor.	Any of reset operations	Excitation
62h	7	Return-to-home operation error	An unanticipated load was applied while return-to-home operation was performed. The installation positions of the FW-LS and RV-LS sensors and the HOME sensor are near to each other. Position preset processing upon completion of return-to-home operation was failed. In return-to-home operation in the one-way rotation mode, the HOME sensor was exceeded while the motor decelerated to a stop.	Check the load. Reconsider the sensor installation positions and the starting direction of motor operation. See that a load exceeding the maximum torque is not applied upon completion of return-to-home operation. Reconsider the specifications of the HOME sensor and the "(HOME) Acceleration/deceleration/ parameter.	Any of reset operations	Excitation
63h	7	No HOMES	The HOMES input was not detected at a position between the FW-LS input and the RV-LS input while return-to-home operation in the 3-sensor mode was performed.	Install the HOME sensor at a position between the FW-LS and RV-LS sensors.	Any of reset operations	Excitation

Alarm code	Number of times LED blinks	Alarm type	Cause	Remedial action	How to reset	Motor excitation *
64h	7	TIM, ZSG, SLIT signal error	None of the TIM output, the ZSG output, or the SLIT input could be detected during return-to-home operation.	Reconsider the connection status of the load and the position of the HOME sensor so that these signals should be ON while the HOMES input is ON. When a signal is not used, set the "(HOME) TIM/ZSG signal detection" parameter or the "(HOME) SLIT detection" parameter to "0: Disable."	Any of reset operations	Excitation
66h	7	Hardware overtravel	When the "FW-LS/RV-LS input action" parameter is set to "2: Immediate stop with alarm" or "3: Deceleration stop with alarm," the FW-LS input or the RV-LS input was detected.	Reset the alarm and then escape from the sensor by operating the motor or manually.	Any of reset operations	Excitation
67h	7	Software overtravel	When the "Software overtravel" parameter is set to "2: Immediate stop with alarm" or "3: Deceleration stop with alarm," the motor position reached the set value of the software limit.	Reconsider the operation data. Reset the alarm and then escape from the sensor by operating the motor or manually.	Any of reset operations	Excitation
6Ah	7	Return-to-home operation offset error	When offset movement as part of return-to-home operation was performed, the FW-LS input or the RV-LS input was detected.	Check the offset value.	Any of reset operations	Excitation
6Dh	7	Mechanical overtravel	The product having set the home reached the mechanism limit stored in the ABZO sensor.	Check the travel amount (position). Reset the alarm and then escape from the sensor by operating the motor or manually.	Any of reset operations	Excitation
70h	7	Operation data error	Stored data operation was performed with data whose operating speed was 0. Operation was performed at the operating speed or operating current exceeding the value set in the "Mechanism protection parameter". Wrap operation was executed when wrap setting was disabled. Push-motion operation or push-motion return-to-home operation was performed with the DGII Series.	Check the operation data. Check the value set in the "Mechanism protection parameter" using the unit information monitor of the MEXEO2 software. Check the wrap setting. Push-motion operation as well as push-motion return-to-home operation cannot be performed with the DGII Series.	Any of reset operations	Excitation
71h	7	Electronic gear setting error	The resolution set in the "Electronic gear A" parameter and "Electronic gear B" parameter were out of the specifications.	Reconsider the "Electronic gear A" parameter and "Electronic gear B" parameter, and set so that the resolution should be in the range of the specifications.	Turn on the main power supply and control power supply again	Non- excitation
72h	7	Wrap setting error	The control power supply was turned on in a state where the resolution and the value set in the "Initial coordinate generation & wrap setting range" parameter were inconsistent.	Set the "Initial coordinate generation & wrap setting range" parameter properly, and turn on the main power supply and the control power supply again.	Turn on the main power supply and control power supply again	Non- excitation

Alarm code	Number of times LED blinks	Alarm type	Cause	Remedial action	How to reset	Motor excitation *
81h	7	Network bus error	Implicit communication of Exclusive Owner connection was disconnected during operation.	Check the connection with the scanner and the condition of the power supply of the scanner.	Any of reset operations	Excitation
82h	7	Network module error	An error was detected in the network module.	Turn on the main power supply and the control power supply again.	Turn on the main power supply and control power supply again	Non- excitation
F0h	Light	CPU error	CPU malfunctioned.	Turn on the main power supply and the control power supply again.	Turn on the main power supply and control power supply again	Non- excitation

^{*} An excitation state of the motor when an alarm is generated is as follows.

Non-excitation: If an alarm is generated, the motor current is cut off and the motor holding force is lost. When an electromagnetic brake motor is used, the electromagnetic brake is in a state of holding the motor shaft.

Excitation: Even if an alarm is generated, the motor current is not cut off and the motor position is held.

■ About causes of the motor combination error (alarm code 45h)

An alarm of the motor combination error is generated in the following conditions.

- When a motor for the AC power supply was connected to the driver.
- When a motor of frame size 20 mm (0.79 in.) or 28 mm (1.10 in.) was connected to the driver and 48 VDC was applied.

2-5 Timing chart

■ When the motor remains in an excitation state even if an alarm is generated

- 1. If an error occurs, the ALM-B output and the MOVE output are turned OFF. At the same time, the motor stops instantaneously.
- 2. When resetting the alarm, turn the operation command OFF, If the alarm is reset while the operation command is input, the motor may start suddenly, causing injury or damage to equipment.
- 3. Remove the cause of the alarm before turning the ALM-RST input ON.
 The alarm is reset, and the ALM-B output and the READY output are turned ON.
- 4. Check the ALM-B output has been turned ON and then turn the ALM-RST input OFF.

■ When the motor puts into a non-excitation state if an alarm is generated

- 1. If an error occurs, the ALM-B output and the MOVE output are turned OFF. At the same time, the motor stops instantaneously.
- 2. When resetting the alarm, turn the operation command OFF, If the alarm is reset while the operation command is input, the motor may start suddenly, causing injury or damage to equipment.
- 3. Remove the cause of the alarm before turning the ALM-RST input ON.
 The alarm is reset, and the ALM-B output and the READY output are turned ON.
- 4. Check the ALM-B output has been turned ON and then turn the ALM-RST input OFF.

3 Information

The driver is equipped with a function to generate information output before an alarm is generated. This function can be utilized for periodic maintenance of equipment by setting a suitable value in the parameter of each information.

For example, utilizing the "Motor temperature information" parameter can prevent equipment malfunction or production stoppage due to motor overheat. In addition, the "Tripmeter information" parameter can be utilized as a reference to do maintenances every time a certain travel distance is reached.

■ Status when information is generated

Information bit output

If information is generated, a bit output (INFO-** output) of the corresponding information is turned ON. A desired output signal can be assigned to the INFO-USRIO output among bit outputs and used. If the assigned output signal is turned ON, the INFO-USRIO output is also turned ON. (Details of bit output \$\sigma\$ p.112)

INFO output

If information is generated, the INFO output is turned ON.

LED indicator

If information is generated, the PWR/ALM LED blinks in blue.

Operation of motor

The motor continues to operate during information unlike in the case of an alarm.

Parameter

Each information has a corresponding "INFO action" parameter. If the parameter is set to "0: No Info reflect," only the bit output of information is turned ON, and the INFO output and LED are not changed.

3-1 Information history

Up to 16 generated information items are stored in the RAM in order of the latest to the oldest. Information items stored as the information history are the information code, generation time, and contents of information. The information history stored in the RAM can be read or cleared if one of the following is performed.

- Read the information history by the monitor command via EtherNet/IP.
- Clear the information history by the maintenance command via EtherNet/IP.
- Read or clear the information history using the **MEXE02** software.

Information history is cleared when the main power supply and control power supply of the driver are turned off because it is stored in the RAM.

3-2 Information list

Information item	Information bit output signal	Cause	Reset condition
Assigned I/O status	INFO-USRIO	The I/O signal set in the "INFO-USRIO output selection" parameter was turned ON.	The I/O signal set in the "INFO- USRIO output selection" parameter was turned OFF.
Position deviation INFO-POSERR		The deviation between the command position and the feedback position exceeded the value set in the "Position deviation information" parameter in the motor output shaft.	The deviation between the command position and the feedback position fell below the value set in the "Position deviation information" parameter in the motor output shaft.
Driver temperature	INFO-DRVTMP	The internal temperature of the driver exceeded the value set in the "Driver temperature information" parameter.	The internal temperature of the driver fell below the value set in the "Driver temperature information" parameter.
Motor temperature INFO-MTRTMP		The detection temperature of the encoder exceeded the value set in the "Motor temperature information" parameter.	The detection temperature of the encoder fell below the value set in the "Motor temperature information" parameter.
Overvoltage	INFO-OVOLT	 The voltage of the main power supply exceeded the value set in the "Overvoltage information" parameter. A large load inertia was suddenly stopped. Vertical operation (elevating operation) was performed. 	The voltage of the main power supply fell below the value set in the "Overvoltage information" parameter.
Undervoltage INFO-UVOLT		 The voltage of the main power supply fell below the value set in the "Undervoltage information" parameter. The main power supply was shut off momentarily or a voltage was insufficient. 	The voltage of the main power supply exceeded the value set in the "Undervoltage information" parameter.
Overload time INFO-OLTIME		A load exceeding the maximum torque was applied for a time period exceeding the value set in the "Overload time information" parameter.	The overload counter fell below the value set in the "Overload time information" parameter.
Speed	INFO-SPD	The feedback speed of the motor exceeded the value set in the "Speed information" parameter.	The feedback speed of the motor fell below the value set in the "Speed information" parameter.

Information item	Information bit output signal	Cause	Reset condition
		The operation start signal in the direction having been stopped by the FW-BLK input or RV-BLK input was turned ON.	
Start operation error	INFO-START	The operation start signal in the direction having been stopped by the FW-LS input or RV-LS input was turned ON.	Operation was started properly.
Start operation end	INI O-STAIL	The operation start signal in the direction having been stopped by the software limit was turned ON.	operation was started properly.
		When operation could not be executed (e.g., the READY output was OFF), the operation start signal was turned ON.	
		When the coordinates were not set (the ABSPEN output was OFF), the ZHOME input was turned ON.	
Start ZHOME error	INFO-ZHOME	When the motor was used with the electrical home coordinate system (the EL-PRST input was ON), return-to-home operation was performed.	Operation was started properly.
Preset request	INFO-PR-REQ	Preset was executed by the position preset or return-to-home operation.	Preset was completed.
Electronic gear setting error	INFO-EGR-E	The resolution set in the "Electronic gear A" parameter and "Electronic gear B" parameter was out of the specifications.	The resolution was set in the range of the specifications.
Wrap setting error	INFO-RND-E	The resolution and the "Initial coordinate generation & wrap setting range" parameter were inconsistent.	The "Initial coordinate generation & wrap setting range" parameter was set in the range of the specifications.
Forward operation prohibition INFO-FW-OT		 The positive software limit was exceeded. Either the FW-LS input or the FW-BLK input was turned ON. 	The position of the motor was in the range of the positive software limit, and in addition, both the FW-LS input and the FW-BLK input were turned OFF.
Reverse operation prohibition INFO-RV-OT		 The negative software limit was exceeded. Either the RV-LS input or the RV-BLK input was turned ON. 	The position of the motor was in the range of the negative software limit, and in addition, both the RV-LS input and the RV-BLK input were turned OFF.
Cumulative load 0	INFO-CULD0	The cumulative load exceeded the value set in the "Cumulative load 0 information" parameter.	The cumulative load fell below the value set in the "Cumulative load 0 information" parameter.
Cumulative load 1 INFO-CIII D1		The cumulative load exceeded the value set in the "Cumulative load 1 information" parameter.	The cumulative load fell below the value set in the "Cumulative load 1 information" parameter.
Tripmeter	INFO-TRIP	The travel distance of the motor exceeded the value set in the "Tripmeter information" parameter.	After one of the following operations was performed, the travel distance (Tripmeter) of the motor fell below the value set in the "Tripmeter information" parameter. • The "Tripmeter information" parameter was set again.
			The "Clear tripmeter" of the maintenance command was executed.

Information item	Information bit output signal	Cause	Reset condition
Odometer INFO-ODO		The cumulative travel distance of the motor exceeded the value set in the "Odometer information" parameter.	After the following operation was performed, the cumulative travel distance (Odometer) of the motor fell below the value set in the "Odometer information" parameter. The "Odometer information" parameter was set again.
Start operation restricted mode	INFO-DSLMTD	 "Teaching, remote operation" was executed using the MEXEO2 software. Configuration was executed. Data was written to the driver from the MEXEO2 software. "Restored to the factory setting" was executed using the MEXEO2 software. 	 Teaching, remote operation was released. Configuration was completed. Writing data was completed. Data was restored to the factory setting.
I/O test mode INFO-IOTEST		 "I/O test" was executed with the MEXE02 software. Configuration was executed. 	The I/O test mode was canceled. Configuration was completed.
Configuration request	INFO-CFG 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1		Configuration was executed.
Reboot request	INFO-RBT	The parameter that required rebooting was changed.	Reboot was executed.

(memo) If the "Preset request" information was generated for 100 ms or more in a state where the "Information auto clear" parameter was set to disable, the preset may have been failed. There are the following two possible reasons that the preset was failed.

- The ABZO sensor is not connected to the driver.
- The preset was executed in a state where the position deviation between the command position and the feedback position was 1.8° or more.

4 Troubleshooting and remedial actions

In motor operation, the motor or the driver may not operate properly due to an improper setting or wrong connection.

When the motor operation cannot be performed properly, refer to the contents provided in this chapter and take an appropriate remedial action.

If the problem persists, contact your nearest Oriental Motor sales office.

Phenomenon	Possible cause	Remedial action
The motor is not excited.The motor output shaft can	Connection error of the motor cable	Check the motor connection.
be rotated by hand.	The FREE input is being ON.	Turn the FREE input OFF.
The motor has a holding torque even if it puts into a non-excitation state.	Effect of dynamic brake.	If the motor puts into a non-excitation state, the motor windings are brought into a state of being short-circuited inside the driver, generating a larger holding torque than when no current is supplied (dynamic brake). To release the dynamic brake, shut off the main power supply and control power supply or turn the FREE input ON.
	When an electromagnetic brake motor is used, the electromagnetic brake is in a holding state.	Check the connection of the electromagnetic brake.Check the input voltage of the control power supply.
	The position (travel amount) is not set in the operation data when positioning operation is performed.	Check the operation data.
The motor does not rotate.	When JOG operation, high-speed JOG operation, or continuous macro operation is performed, the input in the forward direction and that in the reverse direction are simultaneously ON.	Turn both inputs in the forward direction and the reverse direction OFF, and then turn either one ON.
	The STOP input is being ON.	Turn the STOP input OFF.
The motor rotates in the direction opposite to the specified direction.	The "Motor rotation direction" parameter is set wrongly.	Check the setting of the "Motor rotation direction" parameter.
The gearhead output shaft rotates in the direction opposite	A geared motor that rotates in the direction opposite to the motor	With the TS geared type, the gearhead output shaft rotates in the direction opposite to the motor when the gear ratio is 20 or 30.
to the motor.	output shaft is used.	With the Harmonic geared type, the gearhead output shaft always rotates in the direction opposite to the motor.
	Connection error of the motor cable or power supply cable.	Check the connections between the driver, motor and power supply.
Motor operation is unstable.	A value set in the "Base current" parameter is too low.	Check the setting of the "Base current" parameter. If the motor current value is low with respect to a load, the torque will also be low and the operation will be unstable.
	The "Main power mode" parameter is set wrongly.	Check the setting of the "Main power mode" parameter.
	The main power supply starts up slowly or the voltage of the main power supply is unstable.	Set the "Main power mode" parameter to "0: 24 VDC" or "1: 48 VDC" according to the rated voltage of the main power supply.

Phenomenon	Possible cause	Remedial action
	The load is small.	Lower the current with the "Base current" parameter. If the motor output torque is too large with respect to a load, vibration will increase.
Motor vibration is too large.	The "Main power mode" parameter is set wrongly.	Check the setting of the "Main power mode" parameter.
	The main power supply starts up slowly or the voltage of the main power supply is unstable.	Set the "Main power mode" parameter to "0: 24 VDC" or "1: 48 VDC" according to the rated voltage of the main power supply.
The electromagnetic brake is	The power is not supplied to the electromagnetic brake.	Check the connection of the electromagnetic brake.
not put into a state of releasing the motor shaft.	A voltage for the electromagnetic brake is insufficient.	Check the input voltage of the control power supply.

(memo) Check the alarm message using EtherNet/IP or the **MEXE02** when the alarm is being generated.
